In the experiments of Beccarius, a solution of sea-salt increased the light of the luminous water, a solution of nitre did not increase it quite so much. Sal ammoniac diminished it a little, oil of tartar *per deliquium* nearly extinguished it, and the acids entirely. This water poured upon fresh calcined gypsum, rock crystal, ceruss, or sugar, become more luminous. He also tried the effects of it when poured upon various other substances, but there was nothing very remarkable in them. Afterwards, using luminous milk, he found that oil of vitriol extinguished the light, but that of tartar increased it.

This gentleman had the curiosity to try how differently coloured substances were affected by this kind of light; and having, for this purpose, dipped several ribbons in it, the white came out the brightest, next to this was the yellow, and then the green; the other colours could hardly be perceived. It was not, however, any particular colour, but only light, that was perceived in this case. He then dipped boards painted with the different colours, and also glass tubes filled with substances of different colours, in water rendered luminous by the fishes. In both these cases, the

Pholas.

onics, red was hardly visible, the yellow was the brightest, and the violet the duldest. But on the boards, the blue was nearly equal to the yellow, and the green more languid; whereas in the glasses, the blue was inferior to the green.

Of all the liquors to which he put the pholades, milk was rendered the most luminous. A single pholas made seven ounces of milk so luminous, that the faces of persons might be distinguished by it, and it looked as if it was transparent.

Air appeared to be necessary to this light; for when Beccarius put the luminous milk into glass tubes, no agitation would make it shine, unless bubbles of air were mixed with it. Also Montius and Galeatus found, that, in an exhausted receiver, the pholas lost its light, but the water was sometimes made more luminous; which they ascribed to the rising of bubbles of air through it.

Beccarius, as well as Reaumur, had many schemes to render the light of these pholades permanent. For this purpose he kneaded the juice into a kind of paste with flour, and found that it would give light when it was immersed in warm water; but it answered best to preserve the fish in honey. In any other method of preservation, the property of becoming luminous would not continue longer than six months, but in honey it had lasted above a year; and then it would, when plunged in warm water, give as much light as ever it had done.

PHONICS, the doctrine or science of sounds, otherwise called ACOUSTICS. See that article.

PHOSPHORUS, a name given to certain substances which shine in the dark without emitting heat. By this circumstance they are distinguished from the *pyrophori*, which though they take fire on being exposed to the air, are yet entirely destitute of light before this exposure.

Phosphori are divided into several kinds, known by the names of *Bolognian phosphorus*, *Mr Canton's phosphorus*, *Baldwin's phosphorus*, *phosphorus of urine*, &c. of which the last is by far the most remarkable both with respect to the quantity of light which it emits, and its property of taking fire and burning very fiercely upon being slightly heated or rubbed. For the method of preparing these, see CHEMISTRY, n° 193, 476—486.

Besides these, however, it has been found that almost all terrestrial bodies, upon being exposed to the light, will appear luminous for a little time in the dark, metals only excepted. This points out a general division of the phosphori into two classes; namely, such as require to be exposed to the light either of the sun, or of some artificial fire, before they become luminous; and such as do not. Of the former kind are the *Bolognian phosphorus*, *Mr Canton's phosphorus*, the phosphori from earths, &c. Of the latter kind are rotten wood, the skins of fishes, and the phosphorus of urine. To these we may add some other substances which become luminous in another way; *viz.* the mass which remains after the distillation of volatile sal ammoniac with chalk, loaf-sugar, and the phosphorus of urine dissolved in spirit of wine. The first, which is a composition of the marine acid of the sal ammoniac with the chalk, after being fused in a crucible, becomes luminous when struck with any hard body; white sugar is luminous,

when grated or scraped in the dark; and the solution of phosphorus in spirit of wine is luminous only when dropped into water, and even then the light is only perceived where the drops fall into the liquid. One part of phosphorus communicates this property to 600,000 parts of spirit of wine.

There is a remarkable difference between the light of rotten wood, fishes, and that of phosphorus of urine, even when it is not in an ignited state; for this last does not cease to be luminous even when included within an exhausted receiver, the contrary of which happens to rotten wood and fishes. If air is strongly blown upon this phosphorus from a pair of bellows, it will extinguish its light for some time, which is not the case with the other kinds. When kept in water, and placed in a warm air, the phosphorus of urine discharges such large and bright flashes into the air above it, as are apt to surprise and even frighten those who are unacquainted with it. These convulsions are contracted in their passage through the water, but expand as soon as they get above it; however, the experiment can only be tried to advantage in warm weather, and in a cylindrical glass not above three quarters filled with water.

The phenomena exhibited by the earthy phosphori are very curious; both on account of the singular circumstances in which they exhibit their light, and the varieties observed in the light itself. All these, as has been already mentioned, emit no light till they have been first exposed to the light of the sun, or some other luminous body. After that, they are luminous in the dark for a considerable time; but by degrees their light dies away, and they emit no more till after another exposure to the sun. But if this happens to be too long continued, they are then irrecoverably spoiled. The same thing will happen from being too much heated without any exposure to light. Indeed, if a phosphorus, which has just ceased to be luminous, be heated, it will again emit light without any exposure to the sun; but by this its phosphoric quality is weakened, and will at last be destroyed. Indeed these phosphori are so tender, and impatient either of light or heat, that the best method of rendering them luminous occasionally is by discharging an electric bottle near them. The light of the flash immediately kindles the phosphorus, and it continues luminous for a considerable time, after which it may again be revived by another flash, and so on. However, with all the care that can be taken, these phosphori are very far from being perpetual; nor has any method been yet fallen upon to render them so.

The singularities in the light of the phosphori above-mentioned are, that they emit light of many different and most beautiful colours. This difference of colours seems to be natural to them; for some will at first emit a green, others a red, others a violet, &c. at their formation. However, the best kinds agree in this strange property, that if they are exposed to a red light, they emit a red light in the dark; and the same of other colours. But this must not be understood without limitation; nor is the phosphoric light at any time so bright as the luminous body, whatever it was, by which it was kindled. Neither are we to imagine, that any particular phosphorus has a particular kind of light appropriated to it; for the same phosphorus.

Phosphorus which at one time emits a purple light, will at another perhaps emit a green, or a light of some other colour.

The explanation of the principal phenomena of phosphorus is deducible from what has been shown concerning the nature of fire, compared with what is mentioned under the article QUICKLIME. Under this last article it is shown, that, when calcareous earths are deprived of their fixed air, a proportionable quantity of active fire is absorbed by them; that is, the ethereal fluid, which pervades all bodies, has a violent tendency to expand itself, or to act all around every particle of the calcined earth, as from a centre. Of consequence, if this tendency was not counteracted by some other power, these substances would emit a perpetual flame. This power, however, is found in our atmosphere; which has already been shown either to be the positive principle of cold, or to contain it \*. Hence, the latent fire in these substances is checked, and cannot act, excepting within the very substance itself. But if any other body comes in contact with the calcined earth, in which the principle of cold is less vigorous than in the atmosphere, the active fire in the quicklime immediately shows itself, and the body either becomes hot, or is consumed as if by fire. Hence it will follow, that if a very inflammable body is touched by quicklime, it ought to be set on fire. But of this we have no instance, because it is impossible for the quicklime to part with any of its fire, unless it receives something in exchange. This indeed it might receive from the atmosphere; which could supply it either with more fire, if it was in a state of ignition; or with fixed air, if any substance was at hand to receive the fire. But the atmosphere refuses to part with the fire which it contains, because the effort of the fire in the quicksilver is not sufficiently strong to overcome the opposition it meets with in other bodies; and, on the other hand, the effort of the fire in the quicklime is sufficient to keep the earth from attracting fixed air out of the atmosphere. But when water, for instance, is poured on the quicklime, the dry earth absorbs it very greedily, and parts with a proportionable quantity of its latent fire, which the water also absorbs much more readily than the atmosphere. Hence the mixture becomes so exceedingly hot as sometimes to fire combustible bodies. Now, if instead of water we suppose the lime to be mixed with oil, this also will absorb the fire; but not with such force as the water; neither is the heat by any means so considerable; because oil is capable of detaining a vast quantity of heat in a latent state, the only consequence of which is an increase of its fluidity, without any very perceptible change of temperature. At the same time, however, we must remember, that if the oil is in very small quantity, and intimately combined with the quicklime in that peculiar state which we call *phlogiston*, it is easy to conceive, that it may be so much saturated with fire, as to be unable to contain any more without being ignited. In this case, if more fire is forced into the compound, a quantity of the phlogistic matter which it contains will be decomposed; and of consequence, the fire which it has imbibed will be thrown out, as in the common ignition of vapour; and in proportion to the degree of heat thus communicated, will the degree of ignition, and the continuance of it be. If the quantity of heat

is very great, the phlogiston will be dissipated all at once; but if otherwise, the ignition will continue for a much greater length of time, as is the case with a common fire.

To apply this to the accension of phosphori, we must consider, that these substances are all formed by calcining calcareous substances, and combining them with some portion of phlogistic matter. Baldwin's phosphorus is made by dissolving chalk in the nitrous acid, afterwards evaporating the solution, and driving off most of the acid. The consequence of this is, that the earth is left in an exceedingly caustic state, as the acid expels the fixed air more completely than could be done almost by any calcination whatever; at the same time that any phlogistic matter which might have been contained in the mixture is most accurately diffused through it, and combined with it. The Bolognian phosphorus is composed of a gypseous earth, which contains a quantity of vitriolic acid; and as no mineral is to be found perfectly free from phlogistic matter, the vitriolic acid unites with it during the calcination into an exceedingly inflammable sulphur; for the greater the quantity of acid there is in proportion to the phlogiston, the more inflammable is the compound †. Thus the Bolognian, as well as Baldwin's phosphorus, is a compound of quicklime and inflammable matter; and the case is still more plain with regard to Mr Canton's, where the quicklime is mixed with sulphur, and both calcined together.—Neither are the phosphori made by calcining oyster-shells without addition to be accounted any way different from those already mentioned; since the shells always contain some portion of inflammable matter, which, being reduced to a coal by the action of the fire, furnishes a quantity of phlogiston, and imparts it to the whole of the calcareous matter.

Having thus seen that the phosphori of which we now speak are all composed of pure calcareous earth and phlogiston, we are next to consider, that the phlogiston must be in such a state as it is when saturated with fire and ready to inflame. It is not indeed in the state of vapour, because this would require a quantity of fire detached from any other substance, and interposed between the particles of the vapour, in order to keep them at a distance, or to give it elasticity. But the fire which ought to do this is confined by the calcareous earth, which also detains the phlogiston itself. As long therefore as the balance is thus preserved, the phosphorus cannot thine; but as soon as a fresh quantity of light is discharged upon it, then more light or fire (for they are the very same in this case), enters the quicklime than it can contain. The consequence of this is, that the quantity which cannot be retained by the earth, exerts its force upon the phlogiston; which having already as much as it can hold, not only the superfluous quantity is discharged, but also part of that which the phlogiston had absorbed before. The burning indeed is very slow and weak, because the phlogiston is obitarily retained by the earth, which both impedes the ignition, and prevents the dissipation of the phlogiston in vapour. However, as soon as the lime has by its action impeded the farther extrication of the phlogiston, the balance is restored, the fire goes out, and the phosphorus ceases to be luminous. Heat will kindle it again; but thus a larger quantity of phlogistic

\* See the article GOLD, no 4.

† See the article SULPHUR.

phosphorus phlogistic matter is dissipated, and the phosphorus is soon destroyed. Light does the same, but in a much more moderate degree; and therefore the phosphorus may be frequently rekindled by means of light, and will continue its splendor for a long time. But if the light is too long continued, or too violent, it will produce the same consequence whether it is attended with perceptible heat or not.

With regard to the phosphorus of urine, the case is the same; only, instead of the calcareous earth, we have here an acid joined with phlogiston. The latter is in exceeding small quantity, and of consequence so loaded with fire that the least additional heat, rubbing, or alteration in the weather, forces more fire upon it than it can bear, and therefore part of it is continually flashing off in those coruscations formerly mentioned. The reason why this phosphorus flashes like lightning, and the others give only a steady light like coals, is, that the compound is very volatile. It requires indeed a violent fire to distill it at first; but in the distillation so much fire is imbibed, that it seems ever afterwards ready to evaporate spontaneously; and therefore phosphorus, when once made, is easily redistilled in close vessels.

It now remains only to show the reason why the phosphorus of urine and some others will shine under wood, or in an exhausted receiver, while rotten wood, &c. will not. This seems to arise from the quantity of fire which they have internally, and which requires no supply from the external air as in the case of common fire: and hence the phosphorus of urine shines more briskly *in vacuo* than in the air; because the pressure of the atmosphere is then taken off, and the evaporation of the phlogistic matter promoted. The light of filices and rotten wood seems to be of an electric nature; and therefore ceases when the air is exhausted, as on this fluid all the phenomena of electricity are found to depend.

With regard to the various colours of phosphoric light, some have imagined that the earthy substance was capable of imbibing a certain quantity of light, and emitting it afterwards in the very same state, and having the same colour which it had before. But this is now known to be a mistake, and the light of the phosphori is found to be owing to a true accension, though weak, as in other burning bodies. Hence it is very probable that the colour of the light depends upon the degree of accension; for we see that even in common fires the colour depends in a great measure on the strength of the flame. Thus the flame of a candle, where it is not well kindled at bottom, always appears blue. The flame of a small quantity of sulphur, or of spirit of wine, is blue; but if a large quantity of either of these substances be set on fire, the flame will in many places appear white. A strong flame mixed with much smoke appears red. A weak one in similar circumstances appears brown, &c. Hence if the phosphorus is weakly kindled, it will emit a brown, violet, blue, or green flame; if strongly, a red or white one.

It has already been mentioned, that almost all terrestrial bodies have a phosphoric quality; however this, in most of them, is extremely weak, and continues only for a very short time. Signor Beccaria, who discovered this property, in order to find out what

Vol. VIII.

substances were phosphoric, and what were not, had a machine contrived like a dark lantern, in which he included himself, in order to perceive with the greater facility any small quantity of light which might be emitted by the substances which he designed to examine. In the side of the machine was a cylinder capable of being turned about without admitting any light. Upon this were placed the substances he designed to examine, and by turning the cylinder he immediately brought them from the light of the sun into intense darkness; in which situation there were but few substances which did not afford a sufficient quantity of light to render themselves visible. This phenomenon, however, is evidently similar to an optical illusion by which we are made to see what is not present before us; for if we look very intensely upon any thing for some time, suffering no more light to enter our eyes than what is reflected from that object, we will imagine that we still see it, though we remove into the dark or shut our eyes. The reason of this is, that the nervous fluid being once put in motion after a certain manner, continues that motion for a short space of time after the moving cause is removed. In like manner, as the light is partly reflected from bodies, and partly penetrates them, when any body is exposed to the light, and then is suddenly brought into a dark place, the ethereal fluid within its substance being once put into motion does not cease to move immediately, but for a time produces that vibration which we call *light*; for the substance of light is present in the most intense darkness as well as in sunshine. Hence almost all substances are capable of emitting light in the dark, after being exposed to a vigorous sunshine; though the reason of their doing so may be very different from that by which the phosphori become luminous.

Many entertaining experiments may be made with the various kinds of phosphori, especially with that of urine. This last, however, is sometimes dangerous on account of the violence with which it burns. If dissolved in oil of cloves, it loses this property, but continues to be as luminous as before; so that this mixture, called *liquid phosphorus*, may be used with safety. As on some occasions it may be wished to have it in powder, it is proper to observe that this may be done with safety by pouring some hot water upon the phosphorus in a glass mortar. The compound melts, and while in a soft state is easily reducible to powder of any degree of fineness.

*Acid of PHOSPHORUS.* This acid, called also the *microcosmic acid*, has already been described, and the method of procuring it from urine shown, under the article CHEMISTRY, n° 307, 308. Since that article was written, however, it has been discovered by Mr Schele, that an acid capable of making phosphorus is producible from calcined bones or harts horn, and the vitriolic acid. The process for procuring this acid recommended by that gentleman was to dissolve the bones in nitrous acid; afterwards to precipitate the earth by means of the vitriolic acid; to filter and evaporate the liquor to dryness; and, after driving off the nitrous acid, the phosphoric acid remains. This process, however, is expensive on account of the waste of nitrous acid; and is likewise very inconvenient, because a great deal of the earthy matter continues dissolved,

**Phosphorus** even after the vitriolic acid is poured in, and therefore the phosphoric acid is never to be obtained pure; for which reason, the following process is preferable.

Take of calcined bones or hartshorn, one pound; oil of vitriol, 14 ounces. Let the bones be reduced to fine powder; then pour on the acid undiluted, and rub both together till they are as accurately mixed as possible. Having let them remain for some hours in this situation, pour on as much water, stirring and dissolving the lumps into which the mass will now be concreted, till it is all equally distributed through the liquid, and has the consistence of thick gruel. Let it remain 24 hours, and then pour it into a canvas cloth in order to let the liquid drain from it. This is a very tedious operation, as fresh water must continually be pouring on till all the saline matter is washed off. When this is done, pour into the liquid a quantity of caustic volatile alkali, which will occasion a copious precipitation; for the earth of bones is much less strongly attracted by acids than even the caustic volatile alkali. The liquid being now filtered a second time, which will be done with sufficient ease, and afterwards evaporated, there remains a mass composed of phosphoric acid, and vitriolic fial ammoniac. By increasing the fire, the latter is dissipated in vapour; and if the process has been successful, four ounces or more of pure phosphoric acid will remain.

With regard to the properties of this acid, it is not yet ascertained whether they are exactly the same with the microcosmic acid or not. Indeed, as far as yet appears, they seem to be different; and there are very strong reasons for supposing that the phosphoric acid thus produced is no other than the vitriolic altered by its combination with the earth of bones. See the article **BONES** in the APPENDIX.

**PHOTIUS**, patriarch of Constantinople, was one of the finest geniuses of his time, and his merit raised him to the patriarchate; for Bardas having driven Ignatius from the see, Photius was consecrated by Asclepius in 859. He condemned Ignatius in a synod, whereupon the pope excommunicated him, and he, to balance the account, anathematized the pope. Basilus of Macedon, the emperor whom Photius had reproved for the murder of Michael the late emperor, expelled him, and restored Ignatius; but afterward re-established Photius, upon Ignatius's death, in 878. At last, being wrongfully accused of a conspiracy against the person of Leo the philosopher, son and successor to Basilus, he was expelled by him in 886, and is supposed to have died soon after. He wrote a Bibliotheca, which contains an examen of 280 authors: we have also 253 epistles of his; the Nomocanon under 14 titles; an abridgment of the acts of several councils, &c. He was a person of prodigious reading, and the greatest scholar almost of any age.

**PHRASE**, in grammar, an elegant turn or manner of speech, peculiarly belonging to this or that occasion, this or that art, or this or that language. Thus we say, an Italian phrase, an eastern phrase, a poetical phrase, a rhetorical phrase.

**PHRASE** is sometimes also used for a short sentence, or small set or circuit of words constructed together. In this sense, Father Buffier divides phrases into complete and incomplete.

**PHRASES** are complete where there is a noun and a

verb, each in its proper function; i. e. where the noun expresses a subject, and the verb the thing affirmed of it.

**Incomplete PHRASES** are those where the noun and the verb together only do the office of a noun; consisting of several words without affirming any thing, and which might be expressed in a single word. Thus, *that which is true*, is an incomplete phrase, which might be expressed in one word, *truth*; as "that which is true satisfies the mind," i. e. "truth satisfies the mind."

**PHRASEOLOGY**, a collection of the phrases, or elegant expressions, in any language. See **PHRASE**.

**PHRENITIS**, the same with **PHRENSY**; an inflammation of the meninges of the brain, attended with an acute fever and delirium. See **MEDICINE**, n° 284.

**PHRYGIA**, an extensive country of the Hither Asia, on this side mount Taurus, and the river Halys. Reckoned by the ancients twofold, viz. the *Greater* and *Less*, (Livy, Ptolemy.) The Less Phrygia seems to have consisted of two parts; one nearer the Hellespont, from which it is called *Hellepontiaça*: the other, which was to the south of Bithynia, about Olympus, more remote from the Hellespont, and under the dominion of Prusias; but which was afterwards ceded to the Attali, or to Eumenes, by them called *Epiactes*; which in a laxer sense denotes the Minor Phrygia, or the Less; but in a stricter, is distinct from the Phrygia on the Hellespont, and lies at the foot of Olympus, a mountain of Mylia, on the confines of Bithynia: so that we have three Phrygias; Major, Minor, and Epiactes.

**PHTHIRIASIS**, the LOUSY EVIL, from *phus*, "a louse." It is a lousy distemper; children are frequently its subjects, and adults are sometimes troubled with it. The increase of lice, when in a warm moist situation, is very great; but a cold and dry one soon destroys them. On the human body four kinds of lice are distinguished: 1. The *pediculi*, so called because they are more troublesome with their feet than by their bite. These are in the heads of children, especially if sore or scabby; and often in those of adults, if they are slothful and nasty. 2. Crab-lice, see **CRAB-LICE**. 3. Body lice; these infest the body, and breed in the clothes of the nasty and slothful. 4. A sort which breed under the cuticle, and are found in the hands and feet: they are of a round form, and so minute as often to escape the sight: by creeping under the scarfskin they cause an intolerable itching; and when the skin bursts where they lodge, clusters of them are found there. See **ACARUS**.

A good diet and cleanliness conduce much to the destruction of lice. When they are in the head, comb it every day; and, after each combing, sprinkle the pulp. sem. staph. agr. or coccul. Ind. among the hairs every night, and confine it with a tight cap.

Crocodrius, in his treatise on lice, says, that the powdered coc. Ind. exceeds all other means; and that it may be mixed in the pulp of apple, or in lard, and applied every night to the hair. Some writers assert, that if the pul. cort. rad. sassafr. is sprinkled on the head, and confined with a handkerchief, it destroys the lice in one night.

The body-lice are destroyed by any bitter, sour, salt, or mercurial medicine, if applied to the skin.

The

Pharaco-  
logy  
Phtiriasis.

Phthisis  
Phyeter.

The black soap, and the flowers called *cardamine*, or *lady's-smock*, are said to be specifics in all cases of lice on the human body.

**PHTHISIS**, a species of consumption, occasioned by an ulcer in the lungs. See *MEDICINE*, n° 351—353. and p. 4870, 4871.

**PHUL**, or **PUL**, king of Assyria, by some historians said to be Ninus under another name, and the first founder of that monarchy: A renowned warrior. He invaded Israel in the reign of Manahem, who became tributary to him, and paid him 1000 talents of silver for a peace. Flourished 771 B. C.

**PHYLACTERY**, in the general, was a name given by the ancients to all kinds of charms, spells, or characters, which they wore about them, as amulets, to preserve them from dangers or diseases.

**PHYLACTERY** particularly denoted a slip of parchment, wherein was wrote some text of holy scripture, particularly of the decalogue, which the more devout people among the Jews wore on the forehead, the breast, or the neck, as a mark of their religion.

The primitive Christians also gave the name *phylacterie* to the cases wherein they inclosed the relics of their dead.

**PHYLICA**, **BASTARD ALATERNUS**; a genus of the monogynia order, belonging to the pentandria class of plants. There are six species, of which three are kept in the gardens of this country; but, by reason of their being natives of warm climates, they require to be kept in pots, and housed in winter. They are all shrubby plants, rising from three to five or six feet high; and adorned with beautiful clusters of white flowers. They are propagated by cuttings.

**PHYLLANTHUS**, **SEA-SIDE LAUREL**; a genus of the triandria order, belonging to the monoecia class of plants. There are six species, all of them natives of warm climates; and rise from 12 or 14 feet, to the height of middling trees. They are tender, and cannot be propagated in this country without artificial heat.

**PHYSALIS**, the **WINTER CHERRY**; a genus of the monogynia order, belonging to the pentandria class of plants. There are 16 species; of which the most remarkable is the alkekengi, or common winter-cherry. This grows naturally in Spain and Italy. The roots are perennial, and creep in the ground to a great distance if they are not confined. These, in the spring, shoot up many stalks, which rise to the height of a foot or more, garnished with leaves of various sorts; some of which are angular and obtuse, some oblong and sharp pointed, with long foot-stalks. The flowers are produced from the wings, standing upon slender foot-stalks; are of a white colour, and have but one petal. They are succeeded by round berries about the size of small cherries, inclosed in an inflated bladder, which turns red in autumn, when the top opens and discloses the red berry, which is soft, pulpy, and filled with flat kidney-shaped seeds. Soon after the fruit is ripe, the stalks decay to the root. The plant is easily propagated, either by seeds, or parting the roots.

**PHYSETER**, or **SPERMACETI-FISH**, in zoology, a genus belonging to the order of cetæ. There are four species; the most remarkable are,

1. The microps, or black-headed cachalot, with a long fin on the back, and the upper jaw consider-

ably longer than the under one. A fish of this kind was cast ashore on Crumond isle, near Edinburgh, December 22d, 1769; its length was 54 feet; the greatest circumference, which was just beyond the eyes, 30: the upper jaw was five feet longer than the lower, whose length was ten feet. The head was of a most enormous size, very thick, and above one-third the size of the fish: the end of the upper jaw was quite blunt, and near nine feet high: the spout hole was placed near the end of it. The teeth were placed in the lower jaw, 23 on each side, all pointing outwards; in the upper jaw, opposite to them, were an equal number of cavities, in which the ends of the teeth lodged when the mouth was closed. One of the teeth measured eight inches long, the greatest circumference the same. It is hollow within side for the depth of three inches, and the mouth of the cavity very wide: it is thickest at the bottom, and grows very small at the point, bending very much; but in some the flexure is more than in others. These, as well as the teeth of all other whales we have observed, are very hard, and cut like ivory. The eyes are very small, and remote from the nose. The pectoral fins placed near the corners of the mouth, and were only three feet long: it had no other fin, only a large protuberance on the middle of the back. The tail was a little forked, and 14 feet from tip to tip. The penis seven feet and a half long. Linnæus informs us, that this species pursues and terrifies the porpoises to such a degree as often to drive them on shore.

2. The catodon, or round-headed cachalot, with a finula in the snout, and having no back fin. Of this species, a hundred and two of different sizes were cast ashore at one time, on one of the Orkney Isles, the largest 24 feet in length. The head is round, the opening of the mouth small: Sibbald says it has no spout-hole, but only nostrils. But Mr Pennant is of opinion, that the former being placed at the extremity of the nose has been mistaken by him for the latter. Some teeth of this species are an inch and three quarters long, and in the largest part, of the thickness of one's thumb. The top is quite flat, and marked with concentric lines; the bottom is more slender than the top, and pierced with a small orifice; instead of a back fin there was a rough space.

For the method of extracting the spermaceti from the brain of these creatures, see the article *SPERMACETI*.

**PHYSIC**, or **PHYSICK**, the art of healing; properly called *MEDICINE*. The word is formed from the Greek *phusis*, “nature;” in regard medicine consists principally in the observation of nature. See *PHYSICS* and *MEDICINE*.

**PHYSICAL**, something belonging to, or really existing, in nature. In this sense we say a physical point, in opposition to a mathematical one, which only exists in the imagination; a physical substance or body, in opposition to spirit, or metaphysical substance, &c.

**PHYSICIAN**, a person who professes medicine, or the art of healing diseases. See *MEDICINE*.

**PHYSICS**, or **NATURAL PHILOSOPHY**. By the word *physics*, in its most extensive sense, we understand *The science of the operations of nature, and of its productions*.

This definition is alone sufficient to inform us, what are

Physieter,  
Physics.

*Physics.* the particular parts of physics, and what are the means it employs to attain its ends. Thus *NATURAL History*, or *ZOOLOGY*, *BOTANY*, and *MINERALOGY*, describe those bodies that nature produces, as far as they are discernible by our senses. So *CHEMISTRY* and *EXPERIMENTAL Philosophy* discover to us, at least in part, the composition of bodies, and the various alterations of which those compositions are susceptible. So *General* and *Speculative PHYSICS* draws from all these preliminary observations, from all these matters of fact, just consequences relative to the universal laws of nature, to the properties, forces, action, and essential qualities of bodies.

The object of physics being the examination of the whole frame of nature, so far as it is visible and palpable to man, it is easily to conceive, that it must form the most extensive branch of human knowledge, seeing that the operations of nature are varied almost to infinity. To reduce this immense subject into some order, philosophers have begun by dividing all the productions of this globe into three classes, which they call *kingdoms*, and distinguish into the *vegetable*, the *mineral*, and *animal kingdom*. Botany, mineralogy, and natural history properly so called, teach therefore all that is come to the knowledge of man in each of these kingdoms. Chemistry resolves all bodies, and consequently shows the manner in which they are compounded. Philosophers have likewise discovered that the universe is composed of elements, of which there are four, *EARTH*, *WATER*, *FIRE*, and *AIR*. Experimental philosophy, by numberless essays and observations, explains the manner in which these elements operate upon each other, and the effects that they produce. The knowledge of those heavenly bodies, whose various courses fill the vast expanse of the firmament, and of their properties and courses either real or apparent, is comprised in the science of *ASTRONOMY*.

All the ancient oriental nations, including the Hebrews and the Egyptians, were mere novices in physics; and their ignorance seems to prove the infancy of the world. The Greeks, men of a subtle and inquisitive genius, went further, and sometimes guessed right enough, though very rarely. Empedocles, for example, who is ranked by some among the Pythagoreans, professed the system of the four elements in nature; and added thereto two principles, which he called *principium amicitie*, and *principium contentioni*. The first, according to him, is the cause of the coalition of beings; and the second, that of their recession or separation. Was not this derived from the same origin as the celebrated system of the attraction and repulsion of bodies? Whatever was the cause, the progress of physics has ever been slow; and we are astonished when we see ancient writers of the greatest genius, as Plutarch and an hundred others, make use of such wretched reasoning when they mention those subjects that relate to physics.

Among the Romans, Lucretius and Cicero have indeed written on these subjects; but they have only related the opinions of the Greeks, which were not worthy of great regard. Seneca and Pliny went further; and we are obliged to the latter for the useful observations which he has made on many parts of this science, although he is frequently too credulous. Pliny, moreover, does not belong to the class of dogmatic

authors on physics, as he gives only an historical account of these matters.

The first ages of Christianity were the ages of darkness for all the sciences and the arts. It was not till very late, that Bacon baron of Verulam, and some of his cotemporaries, produced the first sparks of those fair lights that have since blazed forth by the happy labours of their successors. Gassendus, Descartes, Rudiger, Newton, Leibnitz, Wolff, and a multitude of other celebrated philosophers, have diffused these lights over philosophy; and all these great men have at last established that method of treating it which is alone able to discover the truth. This method is perfectly simple. They begin with establishing facts by means of experiments and observations, and draw from thence consequences relative to their causes and principles. For, as soon as experience or the senses have discovered what passes in nature, the mind endeavours to discover what cannot be distinguished by the senses; that is to say, what may be the cause or the end of each phenomenon or operation in nature; and by this means it constantly combines the accuracy of observation with the sagacity and rigour of argument.

It is certain, that a diligent observation of the subjects of *MINERALOGY* and *ZOOLOGY*, united with the study of *BOTANY*, affords every possible information relative to natural history in general; that is, we thereby acquire the historical knowledge of all the beings of this globe, that nature produces. *EXPERIMENTAL Philosophy*, aided by *CHEMISTRY*, and several parts of the *MATHEMATICS*, disclose the composition of these beings, and the springs by which nature operates in their production, and in making them produce, in their turn, the mutual effects of the elements, &c. *ASTRONOMY*, of which we have in like manner treated, explains the nature of the celestial bodies and their courses: and all these various sciences, united, conduct us at last, as far as the human mind is able to proceed, to the determination of the general laws of nature in the order of the universe; from whence result *universal* and *speculative Physics*, of which it remains to give a cursory idea. This science, which for some thousand years has been justly called *speculative*, seeing that it has been founded altogether on vain speculations, and suppositions merely ideal, is at length supported by experiments and observations that bear the stamp of manifest demonstrations. It now forms no system, admits of no hypothesis, but such whose veracity and certainty have been previously demonstrated. For which purpose it calls to its assistance all the subordinate sciences, and makes use of their operations in the investigation and establishment of its principles. As *MINERALOGY*, *BOTANY*, *ZOOLOGY*, *CHEMISTRY*, *ANATOMY*, *PHYSIOLOGY*, and almost all the other parts of *PHYSIC*, *GEOGRAPHY*, *EXPERIMENTAL Philosophy*, all the particular sciences which are comprised under the general denomination of *MATHEMATICS*; all these have relation to general physics, and each of them concurs more or less to furnish materials for its sublime operations. When, by the assistance of the labours of these, physics has established the veracity of facts, it then applies the most subtle, abstract, and profound ratiocination, to draw from thence just consequences, and to establish general principles, founded on these facts, relative to the universal laws of nature;

to the celestial bodies, and the true order of the universe; to the elements, and their reciprocal action; to meteors; to bodies that are both visible and tangible; to the reciprocal action of palpable bodies; to the generation of beings in general, and of man in particular; to every production of nature in all the three kingdoms: in a word, it endeavours to account, as far as the weak lights of the human understanding are capable of accounting, for all the phenomena of heaven and earth. See all the abovementioned sciences severally treated in the order of the alphabet.

**PHYSIOGNOMONICS**, among physicians, denote such signs as, being taken from the countenance, serve to indicate the state, disposition, &c. both of the body and mind: and hence the art of reducing these signs to practice is termed *physiognomy*.

**PHYSIOGNOMY**, the art of knowing the humour, temperament, or disposition of a person, from observation of the lines of his face, and the characters of its members or features. The word is formed from the Greek *φύσις*, "nature," and *γινωσκω*, "I know."

Baptista Porta and Robert Fludd are the principal modern authors on physiognomy. The ancient ones are the sophist Adamantius, and Aristotle; the physiognomy of which last we have translated into Latin by De Lacuna.

There seems to be something in physiognomy, and it may perhaps bear a much purer philosophy than what these authors were acquainted withal. This, at least, we dare say, that of all the fanciful arts of the ancients, diffused among the moderns, there is none has so much foundation in nature as this.

There is an apparent correspondence between the face and the mind. The features and lineaments of the one are directed by the motions and affections of the other. there is even a peculiar arrangement of the members of the face, a peculiar disposition of the countenance, to each particular affection, perhaps to each particular idea of the mind. In effect, the language of the face, *physiognomy*, is as copious, nay, perhaps as distinct and intelligible, as that of the tongue.

The foundation of physiognomy is this: The different objects that present themselves to the senses, nay, the different ideas that arise in the mind, do each make some impression on the spirits; and each an impression correspondent or adequate to its cause; therefore each a different impression.

Now, if by repeated acts, or the frequent entertaining of a favourite passion, or vice, which natural temperament has hurried or custom dragged one to, the face is often put in that posture which attends such acts; the animal-spirits will make such patent passages through the nerves (in which the essence of a habit consists), that the face is sometimes unalterably set in that posture, or at least falls insensibly and mechanically into that posture, unless some present object distort it therefrom, or dissimulation hide it.

This reasoning is confirmed by observation. Thus we see great drinkers with eyes generally set to the nose; the adductor muscles being often employed to put them in that posture, in order to view their loved liquor in the glass in the time of drinking; whence those muscles are also denominated *bibitory muscles*. Thus also lascivious persons are remarkable for the

*oculorum mobilis petulantia*, as Petronius calls it.—Hence we may account for the Quakers expecting face waiting the spirit, the melancholy face of moll sectaries, the studious face of men of great application of mind, &c.

Were our observation a little more strict and delicate, we might doubtless not only distinguish habits and tempers, but even professions.—In effect, does there need much penetration to distinguish the fierce look of the veteran soldier, the contentious look of the practised pleader, the solemn look of the minister of state, &c.

Within these few years, one M. Lavater of Zurich has attempted to revive the trade of physiognomy, and published a quarto volume on the certainty and utility of the art. His reasons for believing in it, besides those already given, are to the following purpose. "Every moment we are acting upon physiognomical principles, without being aware of it; and not men only, but the brutes also, even insects, both know their most convenient food, and their enemies, by the outside. What are we doing when we choose out some fruits as the best, or when we prefer one horse to another, but judging, from the outside, of the internal qualities? We then certainly act the physiognomer. That every man is undoubtedly a natural physiognomer, is still more apparent from considering the effects which result from the first sight of persons unknown. We are often much inclined to tell our friends, that we do not like the man before us, altho' we be in no degree acquainted with him. Whoever is an attentive observer of what passes in his own mind, knows that he no sooner sees any person, than certain attendant ideas succeed the first impression, which involve nothing less than a judgment over his dispositions of mind, so far that we pronounce him to be of a quite different cast from some others of our acquaintance. We cannot, in every case, tell exactly why we judge thus, whether it be from his figure, from his eyes, or from his nose. Nor can we always determine, whether the impression be not from different ideas complicated. This is not to be learned by rule; we judge only from a feeling acquired by experience. As physiognomical practice is general, it cannot be but founded in nature; and one should think, therefore, that it possibly might be the subject of science. Does not practice always precede theoretical knowledge?"

The rules for this extraordinary art are not laid down in the volume we now speak of; however, so many things are necessary on the part of the artist, that no body, it would seem, without a tolerable share of self-sufficiency, could engage in the art. The reason is, that it requires virtue in the artist to perceive virtue in the face of him whom he inspects; and consequently, unless the physiognomist is possessed of all the virtues in the world, he will be perpetually drawing false conclusions; for, "No one, (says our author,) certainly is able to discern the look of magnanimity, or the countenance of an exalted soul, but he who is magnanimous himself, who thinks nobly, and who is disposed to act generously."

**PHYSIOLOGY**, properly denotes a discourse of nature, and natural bodies; or, it is that part of natural philosophy which treats of the various phenomena

Phylogeny mena of nature in a scientific and speculative way.  
See **PHYSIOLOGY**.

Picardy.

Among physicians, the term *phylogeny* denotes the history of the human body, and its several constituent parts, with their relations and functions. See **ANATOMY**.

**PHYTOLOGY**, a discourse concerning the kinds and virtues of plants. See **BOTANY**, and **MATERIA Medica**.

**PIAZZA**, in building, popularly called *piache*, an Italian name for a portico, or covered walk, supported by arches.

The word literally signifies a broad open place or square; whence it also became applied to the walks or portico's around them.

**PICA**, in ornithology. See **CORVUS**.

**Pica**, in medicine, a deprivation of appetite, which makes the patient long for what is unfit for food, or incapable of nourishing; as chalk, ashes, coals, platter-lime, &c. See **MEDICINE**, n° 465.

**PICARD**, a native of the Netherlands, who improved upon the errors of the Adamites. He called himself the Son of God; and pretended, that, like a new Adam, he was sent by his father to restore the law of nature, which, according to him, chiefly consisted in community with respect to women, and in going quite naked. It is said, that though marriage was instituted among them, no man was allowed to lie with a woman without first obtaining leave of the chief of the sect. He fortified himself in an island in the river Lifmik, seven leagues from Thabor, the military residence of the famous Zisca; but unhappily for him, 40 of his followers being gone out upon a party, basely plundered some country houses, and killed upwards of 200 persons; upon which Zisca attacked the island, took it, and put all the Picards to the sword, except two, whose lives he spared in order to learn from their own mouths the principles of their religion. This happened in the year 1420.

**PICARD** (John), an able mathematician, and one of the most learned astronomers of the 17th century, was borne at Fleche, and became priest and prior of Rillie in Anjou. Going to Paris, he was in 1666 received into the Academy of Sciences, in quality of astronomer. In 1671, he was sent, by order of the king, to the castle of Uraniburg, built by Tycho Brahe in Denmark, to make astronomical observations there; and from thence he brought the original manuscripts wrote by Tycho Brahe, which are the more valuable as they differ in many places from the printed copies, and contain a book more than has yet appeared. He made important discoveries in astronomy; and was the first who travelled through several parts of France, to measure a degree of the meridian. His works are, 1. A treatise on levelling. 2. Fragments of dioptrics. 3. *Experimenta circa aquas effluentes*. 4. *De mensuris*. 5. *De mensura liquidorum & aridorum*. 6. A voyage to Uraniburg, or astronomical observations made in Denmark. 7. Astronomical observations made in several parts of France, &c. These, and some other of his works, which are much esteemed, are in the sixth and seventh volumes of the Memoirs of the Academy of Sciences.

**PICARDY**, a province of France, bounded on the north by Hainault, Artois, and the sea; on the east,

by Champagne; on the south, by the isle of France; and on the west, by Normandy and the British channel. It is divided into the Upper, Middle, and Lower Picardy; and the principal rivers are the Somme, the Oyse, the Canche, the Lis, the Scarp, the Deule, and the Aa. The soil is very fertile in corn, fruits, and pastures; but it produces no wine. They have a considerable trade in woollen manufactures, and the inhabitants are a very industrious people. Amiens is the capital town.

**PICART** (Bernard), a celebrated engraver, son of Stephen Picart, also a famous engraver, was born at Paris in 1673. He learned the elements of his art from his father, and studied architecture and perspective under Sebastian le Clerc. As he embraced the reformed religion, he settled in Holland to enjoy the free exercise of it; where his genius produced those masterpieces which made him esteemed the most ingenious artist of his age: and a multitude of books are embellished with plates of his engraving. He died in 1733.

**PICENTIA**, (Strabo, Pliny); the capital of the Picentini, whose territory, called *Ager Picentinus*, a small district, lay on the Tufcan sea, from the *Promontorium Minerva*, the fourth boundary of Campania on the coast, to the river Silarus, the north boundary of Lucania, extending within-land as far as the Samnites and Hirpini, though the exact termination cannot be assigned. The Greeks commonly confound the *Picentini* and *Picentes*, but the Romans carefully distinguish them. The former, with no more than two towns that can be named, *Silernum* and *Picentia*; the situation of both doubtful: only Pliny says the latter stood within-land, at some distance from the sea. Now thought to be *Bicenza*, (Hollstenius), in the *Principato Citra* of Naples.

**PICENUS**, (Cæsar, Pliny, Florus); **PICENUS AGER**, (Cicero, Sallust, Livy, Tacitus); *Ager Picentinus*, (Varro): a territory of Italy, lying to the east of Umbria, from the Apennine to the Adriatic; on the coast extending from the river Aefis on the north, as far as the *Prætutiani* to the south. In the upper or northern part of their territory the Umbri excluded them from the Apennine, as far as *Camerinum*, (Strabo); but in the lower or southern part they extended from the Adriatic to the Apennine. A very fruitful territory, and very populous. *Picentes*, the people, (Cicero); from the singular, *Picens*, (Livy): different from the *Picentini*, on the Tufcan sea, tho' called so by the Greeks; but Ptolemy calls them *Piceni*, as does also Pliny. Their territory at this day is supposed to form the greatest part of the March of Ancona, (Cluverius.)

**PICKERY**, in Scots law, petty theft, or stealing things of small value.

**PICKETS**, in fortification, stakes sharp at one end, and sometimes shod with iron, used in laying out the ground, of about three feet long; but, when used for pinning the fascines of a battery, they are from three to five feet long.

**PICKETS**, in artillery, are about five or six feet long, shod with iron, to pin the park lines, in laying out the boundaries of the park.

**PICKETS**, in the camp, are also stakes of about six or eight inches long, to fasten the tent cords, in pitching the tents; also, of about four or five feet long, driven

Picart  
Pickets

Picket  
Piquet.

ven into the ground near the tents of the horsemen, to tie their horses to.

**PICKET**, an out-guard posted before an army, to give notice of an enemy approaching.

**PICKET**, a kind of punishment so called, where a soldier stands with one foot upon a sharp-pointed stake: the time of his standing is limited according to the offence.

**PICQUERING**, a flying war, or skirmish, made by soldiers detached from two armies for pillage, or before a main battle begins.

**PIQUET**, or **PICKET**, a celebrated game at cards, much in use throughout the polite world.

It is played between two persons, with only 32 cards; all the duces, threes, fours, fives, and sixes, being set aside.

In reckoning at this game, every card goes for the number it bears, as a ten for ten; only all court-cards go for ten, and the ace for eleven: and the usual game is one hundred up.—In playing, the ace wins the king, the king the queen, and so down.

Twelve cards are dealt round, usually by two and two; which done, the remainder are laid in the middle: if one of the gamblers finds he has not a court-card in his hand, he is to declare he has *carte blanche*, and tell how many cards he will lay out, and desire the other to discard, that he may shew his game, and satisfy his antagonist that the *carte-blanc* is real; for which he reckons ten.

Each person discards, *i. e.* lays aside a certain number of his cards, and takes in a like number from the stock.—The first, of the eight cards, may take three, four, or five; the dealer all the remainder, if he pleases.

After discarding, the eldest hand examines what suit he has most cards of; and reckoning how many points he has in that suit, if the other have not so many in that or any other suit, he tells one for every ten of that suit.—He who thus reckons most is said to win the point.

The point being over, each examines what *sequences* he has of the same suit, *viz.* how many tierces, or sequences of three, quarts or fours, quintes or fives, sixemes or six's, &c. For a tierce they reckon three points, for a quart four, for a quinte 15, for a sixieme 16, &c. And the several sequences are distinguished in dignity by the cards they begin from: thus ace, king, and queen, are called *tierce major*; king, queen, and knave, *tierce to a king*; knave, ten, and nine, *tierce to a knave*, &c. and the best tierce, quart, or quinte, *i. e.* that which takes its descent from the best card, prevails, so as to make all the others in that hand good, and destroy all those in the other hand.—In like manner, a quart in one hand sets aside a tierce in the other.

The sequences over, they proceed to examine how many aces, kings, queens, knaves, and tens, each holds; reckoning for every three of any sort, three: but here too, as in sequences, he that with the same number of threes, has one that is higher than any the other has, *e. gr.* three aces, has all his others made good hereby, and his adversary's all set aside.—But four of any sort, which is called a *quatorze*, always sets aside three.

All the game in hand being thus reckoned, the el-

delt proceeds to play, reckoning one for every card he plays above a nine, and the other follows him in the suit; and the highest card of the suit wins the trick.—Note, unless a trick be won with a card above a nine (except the last trick), nothing is reckoned for it; though the trick serves afterwards towards winning the cards; and that he who plays last does not reckon for his cards, unless he wins the trick.

The cards being played out, he that has most tricks reckons ten for winning the cards.—If they have tricks alike, neither reckons any thing.—The deal being finished, and each having marked up his game, they proceed to deal again as before, cutting afresh each time for the deal.

If both parties be within a few points of being up, the *carte blanche* is the first thing that reckons, then the point, then the sequences, then the quatorzes or threes, then the tenth cards.

He that can reckon 30 in hand by *carte blanche*, points, quintes, &c. without playing, ere the other has reckoned any thing, reckons 90 for them; and this is called a *repique*.—If he reckons above 30, he reckons so many above 90. If he can make up 30, part in hand and part play, ere the other has told any thing, he reckons for them 60. And this is called a *pique*. Whence the name of the game.—He that wins all the tricks, instead of ten, which is his right for winning the cards, reckons 40. And this is called a *capot*.

**PICRIS**, *Ox-tongue*; a genus of the polygamia æqualis order, belonging to the syngenesia class of plants. There are four species, of which the only remarkable one is the echinoides, or common ox-tongue, growing spontaneously in corn-fields in Britain. It has undivided leaves embracing the stem, with yellow blossoms, which sometimes close soon after noon, at other times remain open till nine at night. It is an agreeable pot-herb while young. The juice is milky, but not too acid.

**PICKLE**, a brine or liquor, commonly composed of salt, vinegar, &c. sometimes with the addition of spices, wherein meat, fruit, and other things are preserved and seasoned.

**PICTS**, the name of one of those nations who anciently possessed the north of Britain. It is generally believed that they were so called from their custom of painting their bodies. But as this custom prevailed among the other ancient inhabitants of Britain, who used the *glastum* of Pliny and the *vitrum* of Mela for the like purpose, it may be asked, Why the name of *Picti* was confined by the Romans to only one tribe, when it was equally applicable to many others? Why should they design them only by an epithet without ever annexing their proper name? Or why should they impose a new name on this people only, when they give their proper name to every other tribe which they have occasion to speak of? As these questions cannot be answered in any satisfactory manner, it is plain we must look for some other derivation of the name.

The Highlanders of Scotland, who speak the ancient language of Caledonia, express the name of this once famous nation by the term *Pìdich*; a name familiar to the ears of the most illiterate, who could never have derived it from the Roman authors. The word *Pìdich* means *plunderers* or *plunderers*. The appellation

Picris  
Picti.

Name.

**Picts.** lation was probably imposed upon this people by their neighbours, or assumed by themselves, some time after the reign of Caracalla, when the unguarded state of the Roman province, on which this people bordered, gave them frequent opportunities of making incursions thither, and committing depredations. Accordingly this name seems to have been unknown till the end of the 3d century. Eumenius the Panegyrist is the first Roman author who mentions this people under their new name of *Picti*, or, with a Latin termination, *Picti*. When we say that this name may have been probably assumed for the reason just now mentioned, we must observe, that, in those days of violence, the character of a robber was attended with no disgrace. If he had the address to form his schemes well, and to execute them successfully, he was rather praised than blamed for his conduct; providing he made no encroachments on the property of his own tribe, or any of its allies. We mean this as no peculiar stigma upon the Picts; for other nations of antiquity, in the like rude state, thought and acted as they did. See THUCYDIDES, lib. 3. p. 3. and VIRG. *Æn.* 7. 745 & 749.

**Origin.** Concerning the origin of the Picts, authors are much divided. Boethius derives them from the Agathyrsi, Pomponius Lætus from the Germans, Bede from the Scythians, Camden and father Innes from the ancient Britons, Sillingfleet from a people inhabiting the Chersonesus Cymbrica, and Keating and O'Flaherty, on the authority of the Pisterj Cashe, derive them from the Thracians. But the most probable opinion is, that they were the descendants of the old Caledonians. Several reasons are urged in support of this opinion by Dr Macpheron; and the words of Eumenes, "Caledonum, sive et Pictorum, silvas, &c." plainly imply that the Picts and Caledonians were one and the same people.

**Language.** As there has been much dispute about the origin of the Picts, so there has been likewise about their language. There are many reasons which make it plain that their tongue was the Gaelic or Celtic; and these reasons are a further confirmation of their having been of Caledonian extract. Through the east and north-east coasts of Scotland (which were possessed by the Picts) we meet with an innumerable list of names of places, rivers, mountains, &c. which are manifestly Gaelic. From a very old register of the priory of St Andrews (Dalrymple's Collections, p. 122.) it appears, that in the days of Hungus, the last Pictish king of that name, St Andrew's was called *Mukrosi*; and that the town now called *Queensferry* had the name of *Ardschinncean*. Both these words are plain Gaelic. The first signifies "the heath or promontory of boars;" and the latter, "the height or peninsula of Kenneth." In the list of Pictish kings published by father Innes, most of the names are obviously Gaelic, and in many instances the same with the names in the list of Scottish or Caledonian kings published by the same author. Had Innes understood any thing of this language, he would not have supposed with Camden that the Picts spoke the British tongue. It was unlucky that the two words on which they built their conjecture (*Strath* and *Aber*) are as common in the Gaelic as they could have been in the British, and at this day make a part of the names of places in countries to which the Pictish

empire never extended. The names of *Strathfillan* and *Lochaber* may serve as instances.

The venerable Bede, as much a stranger to the Celtic as either of the antiquaries just now mentioned, is equally unhappy in the specimen which he gives of the Pictish language in the word *penuahel*, "the head of the wall." Allowing the commutation of the initial *p* into *c*, as in some other cases, this word has still the same meaning in Gaelic, which Bede gives it in the Pictish. It is true, there might have been then, as well as now, a considerable difference between different dialects of the Celtic; and thus, perhaps, that pious author was led to discover five languages in Britain agreeably to the five books of *Moses*: A conceit from which the good man derived a great deal of harmless satisfaction.

The Picts of the earliest ages, as appears from the joint testimony of all writers who examined the subject, possessed only the east and north-east coast of Scotland. On one side, the ancient Drumalbin, or that ridge of mountains reaching from Lochlomond near Dumbarton to the frith of Taine, which separates the county of Sutherland from a part of Ross, was the boundary of the Pictish dominions. Accordingly we find in the life of Columba, that, in travelling to the palace of Brudius, king of the Picts, he travelled over Drumalbin, the *Dorsum Britannie* of Adamnan. On the other side, the territory of the Picts was bounded by the Roman province. After Britain was relinquished by the emperor Honorius, they and the Saxons by turns were masters of those countries which lie between the frith of Edinburgh and the river Tweed. We learn from Bede, that the Saxons were masters of Galloway when he finished his Ecclesiastical History. The Picts, however, made a conquest of that country soon after; so that, before the extinction of their monarchy, all the territories bounded on the one side by the Forth and Clyde, and on the other by the Tweed and Solway, fell into their hands.

The history of the Picts, as well as of all the other ancient inhabitants of Britain, is extremely dark. The Irish historians give us a long list of Pictish kings, who reigned over Pictavia for the space of eleven or thirteen centuries before the Christian æra. After them Innes, in his Critical Essay, gives us a list of above fifty, of whom no less than five held the sceptre, each for a whole century. It is probable that these writers had confounded the history of the Picts with that of their ancestors the old Caledonians. In any other view, their accounts of them are highly fabulous; and have been long ago confuted by Dr Macpheron of Slate, an antiquary of much learning and research. The Picts, as has been already observed, were probably not known by that name before the 2d or 3d century. Adamnan, abbot of Jona, is the first author that expressly mentions any Pictish king; and the oldest after him is Bede. We are informed by these two writers that St Columba converted Brudius king of the Picts to the Christian faith. Columba came into Britain in the year of the vulgar æra 565. Before that period we have no general record to ascertain so much as the name of any Pictish king. The history of *Druft* or *Drest*, who is said to have reigned over the Picts in the beginning of the fifth century, when St Ninian first preached the gospel to that

Territory

History.

that nation, has all the appearance of fiction. His having reigned a hundred years, and his putting an end to a hundred wars, are stories which exceed all the bounds of probability.

Brudius, the cotemporary of Columba, is the first Pictish king mentioned by any writer of authority. What figure his ancestors made, or who were his successors on the throne of Pictavia, cannot be ascertained. Bede informs us, that, during the reign of one of them, the Picts killed Egfrid king of Northumberland in battle, and destroyed the greatest part of his army. The same author mentions another of their kings called *Naitan*, for whom he had a particular regard. It was to this *Naitan* that Ceolfird, abbot of Wiremouth, wrote his famous letter concerning Easter and the Tonsure; a letter in which Bede himself is supposed to have had a principal hand. Roger Hoveden and Simon of Durham mention two other Pictish kings *Onnust* and *Kinoth*, the first of whom died in 761, and the latter flourished about the 774, and gave an asylum to Alfred of Northumberland, who was much about that time expelled his kingdom. The accounts given by the Scots historians of several other Pictish kings cannot be depended on; nor are the stories told by the British historians, Geoffrey of Monmouth and the author of the *Eulogium Britannie*, worthy of much greater credit.

In the ninth century the Pictish nation was totally subdued by the Scots in the reign of Kenneth Mac-Alpin. Since that time their name has been lost in that of the conquerors, with whom they were incorporated after this conquest; however, they seem to have been treated by the Scottish kings with great lenity, so that for some ages after they commanded a great deal of respect. The prior of Hogulstead, an old English historian, relates that they made a considerable figure in the army of *David* the Saint, in his disputes with *Stephen*, king of England. In a battle fought in the year 1136, by the English on one side, and the Scots and Picts on the other, the latter insisted on their hereditary right of leading the van of the Scots army, and were indulged in that request by the king.

The principal feat of the Pictish kings was at Abernethy. Brudius, however, as appears from the accounts given by Adamnan, in his life of Columba, had a palace at Inverness, which was probably near the extremity of his territory in that quarter; for, there is no good reason for believing, with Camden, that this king had an property in the Western Isles, or that he had made a gift of *Jona* to St Columba when he visited him in that place.

With respect to the manners and customs of the Picts, there is no reason to suppose they were any other than those of the old Caledonians and Scots, of which many particulars are related in the Greek and Roman writers who have occasion to speak of those nations.

Picts Wall, in antiquity, a wall begun by the emperor Adrian, on the northern bounds of England, to prevent the incursions of the Picts and Scots. It was first made only of turf strengthened with palisades, till the emperor Severus, coming into Britain in person, built it with solid stone. This wall, part of which still remains, begun at the entrance of the Sol-

way Frith in Cumberland, and running north-east extended to the German Ocean. See ADRIAN and SEVERUS.

PICTURE, a piece of painting, or a subject represented in colours, on wood, canvas, paper, or the like. See PAINTING.

PICUS, the WOODPECKER, in ornithology, a genus belonging to the order of pice. The beak is straight, and consists of many sides, and like a wedge at the point; the nostrils are covered with bristly feathers; the tongue is round like a worm, very long, and sharp at the point, which is beset with bristles bent backwards. There are 21 species, principally distinguished by their colour. The following are known in Britain, viz.

1. The viridis, or green woodpecker, weighs six ounces and a half. Its length is 13 inches, the breadth 20 and a half; the bill is dusky, triangular, and near two inches long: the crown of the head is crimson, spotted with black; the eyes are surrounded with black, and the males have a rich crimson mark beneath the blackness. The back, neck, and lesser coverts of the wings, are green: the rump, of a pale yellow. The whole of the under part of the body is of a very pale-green; and the thighs and vent are marked with dusky lines. The legs and feet are of a cinereous green. The tail consists of ten stiff feathers, whose ends are generally broken, as the bird rests on them in climbing: their tips are black; the rest of each is alternately barred with dusky and deep green. These birds feed entirely on insects; and their principal action is that of climbing up and down the bodies or boughs of trees: for the first purpose they are provided with a long slender tongue, armed with a sharp bony end barbed on each side, which by the means of a curious apparatus of muscles they can exert at pleasure, darting it to a great length into the clefts of the bark, transfixing and drawing out the insects that lurk there. They make their nests in the hollows of trees: in order therefore to force their way to those cavities, their bills are formed strong, very hard, and wedge-like at the end; Dr Derham observes, that a neat ridge runs along the top, as if an artist had designed it for strength and beauty. Yet it has not power to penetrate a sound tree: their perforation of any tree is a warning to the owner to throw it down. Their legs are short, but strong; their thighs very muscular: their toes disposed, two backwards, two forward: the feathers of the tail are very stiff, sharp-pointed, and bending downwards. The three first circumstances do admirably concur to enable them to run up and down the sides of trees with great security; and the strength of the tail supports them firmly when they continue long, in one place, either where they find plenty of food, or while they are forming an access to the interior part of the timber. This form of the tail makes their flight very awkward, as it inclines their body down, and forces them to fly with short and frequent jerks when they would ascend, or even keep in a line. This species feeds oftener on the ground than any other of the genus: all of them make their nests in the hollows of trees; and lay five or six eggs, of a beautiful semi-transparent white.

2. The major, or great spotted woodpecker, weighs

Picus.

two ounces three quarters; the length is nine inches; the breadth is 16. The bill is one and a quarter long, of a black horn colour. The irides are red. The forehead is of a pale buff colour; the crown of the head a glossy black; the hind-part marked with a rich deep crimson spot. The cheeks are white; bounded beneath by a black line that passes from the corner of the mouth and surrounds the hind-part of the head. The neck is encircled with a black colour. The throat and breast are of a yellowish white; the vent-feathers of a fine light crimson. The back, rump, and coverts of the tail, and lesser coverts of the wings, are black; the scapular feathers and coverts adjoining to them, are white. The quill-feathers are black, elegantly marked on each web with round white spots. The four middle feathers of the tail are black, the next tipped with dirty yellow; the bottoms of the two outermost, black; the upper parts, a dirty white. The exterior feathers marked on each web with two black spots; the next with two on the inner web, and only one on the other. The legs are of a lead colour. The female wants that beautiful crimson spot on the head; in other respects the colours of both agree. This species is much more uncommon than the preceding; and keeps altogether in the woods.

3. The medius, or middle-sized woodpecker, agrees with the preceding in colours and size, excepting that the crown of the head in this is of a rich crimson; the crown of the head in the male of the former, black; and the crimson is in form of a bar on the hind part. Birds thus marked have been shot in Lancashire and other parts of England; but Mr Pennant is doubtful whether they are varieties, or distinct species.

4. The minor, or least spotted woodpecker, scarce weighs an ounce: the length is six inches; the breadth eleven. The forehead is of a dirty white: the crown of the head (in the male) of a beautiful crimson: the cheeks and sides of the neck are white, bounded by a band of black beneath the former. The hind part of the head and neck, and the coverts of the wings, are black: the back is barred with black and white: the scapulars and quill-feathers spotted with black and white: the four middle feathers of the tail are black; the others varied with black and white: the breast and belly are of a dirty white: the crown of the head (in the female) is white; the feet are of a lead colour. It has all the characters and actions of the greater kind, but is not so often met with.

PICUS (John), earl of Mirandula, a prodigy of parts and learning, was the youngest child of John Francis Picus, earl of Mirandula and Concordia; and was born in the year 1463. The progress that he made in letters was so extremely rapid, that it was matter of astonishment to see even a boy one of the first poets and orators of his age. After visiting the most famous universities of France and Italy, he went to Rome; where, in 1486, before he was 24 years of age, he published 900 propositions in logic, mathematics, physics, divinity, cabalistic learning, and magic, drawn not only from Greek and Latin, but even from Jewish and Arabian writers: subjoining to his advertisement, that, "if any philosopher or divine would come to Rome to dispute with him, upon any or all of them, he would defray the expences of his journey from the remotest corners of Italy." He

enjoyed, however, the honour of this disputatious challenge quietly, without danger to his credit; for envy procured some of his propositions to be charged with heresy, and he was forbid to dispute upon them. At the age of 28, he confined himself wholly to the study of the scriptures; and undertook to combat the Jews and Mahometans, as well as to confound judicial astrology; but in this intention his credit was also saved, tho' with the loss of his life, by his dying in 1494, in his 32d year. He was called the *phœnix of his age*; and composed a great number of works, which have often been printed both separately and together.

PICUS (John Francis), prince of Mirandula, nephew of John Picus mentioned above, was born about the year 1469. He cultivated learning and the sciences after the example of his uncle; but he had a principality and dominions to superintend, which involved him in great troubles, and at last cost him his life. He was twice driven from his principality, and twice restored; and at last, in 1533, was, together with his eldest son Albert, assassinated in his own castle by his nephew Galeotti. He was a great lover of letters; and such of his works as were then composed, were inserted in the Straßburg edition of his uncle's in 1504, and continued in future impressions, besides some others, which were never collected.

PIECE, in matters of money, signifies sometimes the same thing with species; and sometimes, by adding the value of the pieces, it is used to express such as have no other particular name. For the piece of eight, or piastre, see *MONEY-Table*.

PIECE, is also a kind of money of account, or rather a manner of accounting used among the negroes on the coast of Angola in Africa. See *MONEY-Table*.

PIECE, in heraldry, denotes an ordinary or charge. —The honourable pieces of the shield are the chief, fess, bend, pale, bar, cross, saltier, chevron, and in general all those which may take up one-third of the field, when alone, and in what manner soever it be. See *HERALDRY*.

PIECES, in the military art, include all sorts of great guns and mortars. Battering pieces are the larger sort of guns used at sieges for making the breaches; such are the 24-pounder and culverin, the one carrying a 24 and the other an 18 pound ball. Field-pieces are 12-pounders, demiculverines, 6-pounders, sackers, minions, and 3-pounders, which march with the army, and encamp always behind the second line, but in day of battle are in the front. —A soldier's firelock is likewise called his *piece*.

PIEDMONT, a country of Italy, with the title of a principality; bounded on the north by Vallois; on the east, by the duchy of Milan and the duchy of Montferrat; on the south, by the county of Nice and the territory of Genoa; and on the west, by Dauphiny and Savoy. It comprehends 11 small provinces, Piedmont Proper, the valleys between France and Italy, the valley of Saluzza, the county of Nice, the marquissate of Susa, the duchy of Aost, the Canavese, the lordship of Verfail, the county of Aill, and the Langes. It was formerly a part of Lombardy; but now belongs to the king of Sardinia; and lies at the foot of the Alps, which separate France from Italy. It is 175 miles in length, and 40 in breadth. It contains many high mountains; among which there are rich and fruitful

Picus  
Piedmont.

Pieria  
#  
Piepoudre.

ful valleys, as pleasant and populous as any part of Italy. In the mountains are mines of several kinds, and the forests afford a great deal of game. The Piedmontese have more sense than the Savoyards, but then they are not so sincere. They are generally strongly attached to the Roman Catholic religion; and carry on so great a trade in raw silk, that the English alone have purchased to the value of 200,000 pounds in a year. Besides this, they have corn, rice, wine, fruits, hemp, flax, and cattle. Their sovereign is the king of Sardinia; who generally resides at Turin, the capital of this country. The valleys between France and Italy are inhabited by the Vaudoise, who are Protestants. Towards the end of the last century, the French king persuaded the duke of Savoy to drive them out of the country, in consequence of which 20,000 of them retired to Germany, England, and Holland; and yet they are not at all extirpated, tho' they are obliged to have a Roman Catholic church in every parish.

PIERIA (anc. geog.), a district of Macedonia, contained between the mouths of the rivers Ludias and Peneus; extended by Strabo beyond the Ludias, to the river Axios on the north, and on the south no farther than the Aliacmon, along the west side of the Sinus Thermaicus.—Another *Pieria* of Syria, the north part of Seleucia, or the *Antiochena*, situate on the Sinus Ifficus, and lying next Cilicia to the north-west.

PIERIS (anc. geog.), a mountain which is thought to have given name to *Pieria* of Macedonia; taking its name from *Pierus* a poet, who was the first that sacrificed to the Muses, thence called *Pierides*, if credited may be given to an ancient scholiast on Juvenal.

PIEPOUDRE (*Court of*), the lowest, and at the same time the most expeditious, court of justice known to the law of England. It is called *piepoudre*, (*curia pedis pulverizati*), from the dusty feet of the suitors; or, according to Sir Edward Coke, because justice is there done as speedily as dust can fall from the foot: Upon the same principle that justice among the Jews was administered in the gate of the city; that the proceedings might be the more speedy, as well as public. But the etymology given us by a learned modern writer is much more ingenious and satisfactory; it being derived, according to him, from *pied puldreux*, “a pedlar,” in old French, and therefore signifying the court of such petty chapmen as resort to fairs or markets. It is a court of record, incident to every fair and market; of which the steward of him who owns or has the toll of the market, is the judge. It was instituted to administer justice for all commercial injuries done in that very fair or market, and not in any preceding one. So that the injury must be done, complained of, heard, and determined, within the compass of one and the same day, unless the fair continues longer. The court hath cognizance of all matters of contract that can possibly arise within the precinct of that fair or market; and the plaintiff must make oath that the cause of an action arose there. From this court a writ of error lies, in the nature of an appeal, to the courts at Westminster. The reason of its institution seems to have been, to do justice expeditiously among the variety of persons that resort from distant places to a fair or market; since it is probable, that no other inferior court might be able to

Pier  
#  
Pike.

serve its process, or execute its judgments, on both or perhaps either of the parties; and therefore, unless this court had been erected, the complaint must necessarily have resorted even in the first instance to some superior judicature.

PIER, in building, denotes a mass of stone, &c. opposed by way of fortrefs to the force of the sea, or a great river, for the security of ships that lie at harbour in any haven.

PIERIDES, in fabulous history, the daughters of *Pierus* a Macedonian prince, presuming to dispute with the muses for the prize of poetry, were turned into magpies. The name of *Pierides* was also given to the muses, from mount *Pieris* in Thessaly, which was consecrated to them; or, according to others, from *Pierus*, a Thessalian poet, who was the first who sacrificed to them. See *PIERIS*.

PIERINO DEL VAGA, an eminent Italian painter, born of poor parents in Tuscany, about the year 1500. He was placed apprentice with a grocer in Florence, and got some instructions from the painters to whom he was sent with colours and pencils; but a painter named *Vaga* taking him to Rome, he was called *Del Vaga*, from living with him, his real name being *Buonacorsi*. He studied anatomy with the sciences necessary for his profession; and had somewhat of every thing that was good in his compositions. After *Raphael's* death, he joined with *Julio Romano* and *Francisco Penni* to finish the works in the Vatican which were left imperfect by their common master; and to confirm their friendship, married *Penni's* sister. He gained the highest reputation by his performances in the palace of prince *Doria* at Genoa: but the multiplicity of his business and the vivacity of his imagination, drained his spirits in the flower of his age; for he died in the year 1547.

PIETISTS, a religious sect sprung up among the Protestants of Germany, seeming to be a kind of mean between the *Quakers* of England, and the *Quietists* of the Romish church.

They despise all sorts of ecclesiastical polity, all school theology, and all forms and ceremonies, and give themselves up to contemplation and the mystic theology.

PIG, in zoology. See *Sus*.

Guinea-PIG. See *Mus*.

PIG of Lead, the eighth part of a sother, amounting to 250 pounds weight.

PIGEON, in ornithology. See *COLUMBA*.

Carrier-PIGEON. See *CARRIER*, and *COLUMBA*.

PIGMENTS, preparations used by painters, dyers, &c. to impart colours to bodies, or to imitate particular colours. See *COLOUR-Making*, and *DYEING*.

PI-HAHIROTH, (*Moses*); understood to be a mouth or narrow pass between two mountains, called *Chiroth*, or *Eiroth*, and lying not far from the bottom of the western coast of the Arabian gulf; before which mouth the children of Israel encamped, just before their entering the Red Sea, (*Wells*).

PIKE, in ichthyology. See *ESOX*.

The pike never swims in shoals as most other fish do, but always lies alone; and is so bold and ravenous, that he will seize upon almost any thing less than himself. This fish breeds but once in a year, which is in March. It is found in almost all fresh waters; but is very dif-

ferent in goodness, according to the nature of the places where it lives. The finest pike are those which feed in clear rivers; those in ponds and meres are inferior to these, and the worst of all are those of the fen ditches. They are very plentiful in these last places, where the water is foul and coloured; and their food, such as frogs and the like, very plentiful, but very coarse; so that they grow large, but are yellowish and high belled, and differ greatly from those which live in the clearer waters.

The fishermen have two principal ways of catching the pike; by the ledger, and by the walking-bait.

The ledger-bait is fixed in one certain place, and may continue while the angler is absent. This must be a live bait, a fish or frog; and among fish, the dace, roach, and gudgeon, are the best; of frogs, the only caution is to choose the largest and yellowest that can be met with. If the bait be a fish, the hook is to be stuck through the upper lip, and the line must be 14 yards at least in length; the other end of this is to be tied to a bough of a tree, or to a stick driven into the ground near the pike's haunt, and all the line wound round a forked stick, except about half a yard. The bait will by this means keep playing so much under water, and the pike will soon lay hold of it.

If the bait be a frog, then the arming wire of the hook should be put in at the mouth, and out at the side; and with a needle and some strong silk, the hinder-leg of one side is to be fastened by one stitch to the wire-arming of the hook. The pike will soon seize this, and must have line enough to give him leave to get to his haunt and poach the bait.

The trolling for pike is a pleasant method also of taking them: in this a dead bait serves, and none is so proper as a gudgeon.

This is to be pulled about in the water till the pike seizes it; and then it is to have line enough, and time to swallow it: the hook is small for this sport, and has a smooth piece of lead fixed at its end to sink the bait; and the line is very long, and runs through a ring at the end of the rod, which must not be too slender at top.

The art of feeding pike, so as to make them very fat, is the giving them eels; and without this it is not to be done under a very long time; otherwise perch, while small, and their prickly fins tender, are the best food for them. Bream put into a pike-pond are a very proper food: they will breed freely, and their young ones make excellent food for the pike, who will take care that they shall not increase over much. The numerous shoals of roaches and ruds, which are continually changing place, and often in floods get into the pike's quarters, are food for them for long time.

Pike, when used to be fed by hand, will come up to the very shore, and take the food that is given them out of the fingers of the feeder. It is wonderful to see with what courage they will do this, after a while practising; and it is a very diverting sight when there are several of them nearly of the same size, to see what striving and fighting there will be for the best bits when they are thrown in. The most convenient place is near the mouth of the pond, and where there is about half a yard depth of water; for, by that means, the offal of the feedings will all lie in one place, and the deep water will serve for a place to retire into and

rest in, and will be always clean and in order.

Carp will be fed in the same manner as pike; and though by nature a fish as remarkably shy and timorous as the pike is bold and fearless, yet by custom they will come to take their food out of the person's hand; and will, like the pike, quarrel among one another for the nicest bits.

PIKE, in war, an offensive weapon, consisting of a wooden shaft, 12 or 14 feet long, with a flat steel head, pointed, called the *spear*. This weapon was long in use among the infantry; but now the bayonet, which is fixed on the muzzle of the firelock, is substituted in its stead. It is still used by some of the officers of infantry, under the name of *sponton*.—The Macedonian phalanx was a battalion of pike-men.

PILASTER, in architecture. See there, n° 55.

PILCHARD, in ichthyology, a fish which has a general likeness to the herring, but differs in some particulars very essential. The body of the pilchard is less compressed than that of the herring, being thicker and rounder: the nose is shorter in proportion, and turns up: the under jaw is shorter. The back is more elevated; the belly less sharp: the dorsal fin of the pilchard is placed exactly in the centre of gravity, so that when taken up by it, the body preserves an equilibrium, whereas that of the herring dips at the head: The scales of the pilchard adhere very closely, whereas those of the herring very easily drop off. The pilchard is in general less than the herring; but it is fatter, or more full of oil.

The pilchard appears in vast shoals off the Cornish coasts about the middle of July, disappearing the beginning of winter, yet sometimes a few return again after Christmas. Their winter retreat is the same with that of the herring, and their motives for migrating the same†. They affect, during summer, a warmer latitude; for they are not found in any quantities on any of our coasts except those of Cornwall, that is to say, from Povey harbour to the Scilly isles, between which places the shoals keep shifting for some weeks. The approach of the pilchard is known by much the same signs as those that indicate the arrival of the herring. Persons, called in Cornwall *huers*, are placed on the cliffs, to point to the boats stationed off the land the course of the fish. By the 1st of James I. c. 23, fishermen are empowered to go on the grounds of others to hue, without being liable to actions of trespass, which before occasioned frequent lawsuits.

The emoluments that accrue to the inhabitants of that county are great, and are best expressed in the words of Dr W. Borlase, in his account of the Pilchard Fishery. "It employs a great number of men on the sea, training them thereby to naval affairs; employs men, women, and children, at land, in salting, pressing, washing, and cleaning, in making boats, nets, ropes, casks, and all the trades depending on their construction and sale. The poor is fed with the offals of the captures; the land with the refuse of the fish and salt; the merchant finds the gains of commission and honest commerce; the fisherman, the gains of the fish. Ships are often freighted hither with salt, and into foreign countries with the fish, carrying off at the same time part of our tin. The usual produce of the number of hogheads exported each year, for ten years, from 1747 to 1756 inclusive, from the

four ports of Fowy, Falmouth, Penzance, and St Ives, it appears that Fowy has exported yearly 1732 hogheads; Falmouth, 14,631 hogheads and two-thirds; Penzance and Mounts-Bay, 12,149 hogheads and one-third; St Ives, 1282 hogheads: in all amounting to 29,795 hogheads. Every hoghead for ten years last past, together with the bounty allowed for every hoghead exported, and the oil made out of each hoghead, has amounted, one year with another at an average, to the price of 1*l.* 13*s.* 3*d.*; so that the cash paid for pilchards exported has, at a medium, annually amounted to the sum of 49,532*l.* 10*s.* The numbers that are taken at one shooting out of the nets, is amazingly great. Mr Pennant says, that Dr Borlase assured him, that on the 5th of October 1767, there were at one time inclosed in St Ives's Bay 7000 hogheads, each hoghead containing 35,000 fish, in all 245,000,000.

**PILE**, in heraldry, an ordinary in form of a wedge, contracting from the chief, and terminating in a point towards the bottom of the shield.

**PILE**, in antiquity, a pyramid built of wood, on which the bodies of the deceased were laid in order to be burnt.

**PILE**, in building, is used for a large stake rammed into the ground in the bottom of rivers, or in marshy land, for a foundation to build upon.

**Pile** is also used among architects for a mass of building.

**PILE**, in coinage, denotes a kind of puncheon, which, in the old way of coining with the hammer, contained the arms or other figure and inscription to be struck on the coin. See **COINAGE**.

Accordingly we still call the arms-side of a piece of money the *pile*, and the head the *cross*; because in ancient coin, a cross usually took the place of the head in ours.

**PILE-Engine**, a very curious machine invented by Mr Vauloue for driving the piles of Westminster bridge. It is represented Plate CCXLV. A is a great upright shaft or axle, on which are the great wheel B, and the drum C, turned by horses joined to the bars S, S. The wheel B turns the trundle X, on the top of whose axis is the fly O, which serves to regulate the motion, and also to act against the horses, and to keep them from falling when the heavy ram Q is discharged to drive the pile P down into the mud in the bottom of the river. The drum C is loose upon the shaft A, but is locked to the wheel B by the bolt Y. On this drum the great rope HH is wound; one end of the rope being fixed to the drum, and the other to the follower G, to which it is conveyed over the pulleys I and K. In the follower G is contained the tongs F, that takes hold of the ram Q by the staple R, for drawing it up. D is a spiral or fuly fixed to the drum, on which is wound the small rope T that goes over the pulley U, under the pulley V, and is fastened to the top of the frame at 7. To the pulley-block V is hung the counterpoise W, which hinders the follower T from accelerating as it goes down to take hold of the ram; for as the follower tends to acquire velocity in its descent, the line T winds downwards upon the fuly, on a larger and larger radius, by which means the counterpoise W acts stronger and stronger against it; and so allows it to come down with only a moderate and uniform velo-

city. The bolt Y locks the drum to the great wheel, being pushed upward by the small lever z, which goes through a mortoise in the shaft A, turns upon a pin in the bar 3, fixed to the great wheel B, and has a weight 4, which always tends to push up the bolt Y through the wheel into the drum. L is the great lever turning on the axis m, and resting upon the forcing bar 5, 5, which goes through a hollow in the shaft A, and bears up the little lever z.

By the horses going round, the great rope H is wound about the drum C, and the ram Q is drawn up by the tongs F in the follower G, until the tongs comes between the inclined planes E; which, by shutting the tongs at the top, opens it at the foot, and discharges the ram which falls down between the guides bb upon the pile P, and drives it by a few strokes as far into the mud as it will go; after which, the top part is sawed off close to the mud by an engine for that purpose. Immediately after the ram is discharged, the piece 6 upon the follower G takes hold of the ropes aa, which raise the end of the lever L, and cause it's end N to descend and press down the forcing bar 5 upon the little lever z, which, by pulling down the bolt Y, unlocks the drum C from the great wheel B; and then the follower being at liberty, comes down by its own weight to the ram; and the lower ends of the tongs slip over the staple R, and the weight of their heads causes them to fall outward, and shuts upon it. Then the weight 4 pushes up the bolt Y into the drum, which locks it to the great wheel, and so the ram is drawn up as before.

As the follower comes down it causes the drum to turn backward, and unwinds the rope from it, whilst the horses, great wheel, trundle and fly, go on with an uninterrupted motion; and as the drum is turning backward, the counterpoise W is drawn up, and its rope T wound upon the spiral fuly D.

There are several holes in the under side of the drum, and the bolt Y always takes the first one that it finds when the drum stops by the falling of the follower upon the ram; until which stoppage the bolt has not time to slip into any of the holes.

This engine was placed upon a barge on the water, and so was easily conveyed to any place desired. The ram was a ton weight; and the guides bb, by which it was let fall, were 30 feet high.

**PILES**, in medicine, the same with hæmorrhoids. See **MEDICINE**, n° 354, 358.

**PILGRIM**, one who travels through foreign countries to visit holy places, and to pay his devotion to the reliques of dead saints. See **PILGRIMAGE**.

The word is formed from the Flemish *pelgrim*, or Italian *peligrino*, which signifies the same; and those originally from the Latin *peregrinus*, a "stranger or traveller."

**PILGRIMAGE**, a kind of religious discipline, which consists in taking a journey to some holy place, in order to adore the relics of some deceased saint. Pilgrimages began to be made about the middle ages of the church; but they were most in vogue after the end of the 11th century, when every one was for visiting places of devotion, not excepting kings and princes themselves; and even bishops had no difficulty of being absent from their churches on the same account.

The

Pilkington  
Pillory.

The places most visited were Jerusalem, Rome, Compostella, and Tours; but the greatest numbers now resort to Loretto, in order to visit the chamber of the blessed virgin, in which she was born, and brought up her son Jesus till he was 12 years of age.

PILKINGTON (*Lætitia*), a famous poetical genius, the daughter of Dr Van Lewin, a physician of Dublin, where she was born in 1712. She was married very young to the rev. Matthew Pilkington, a poet also of no inconsiderable merit; and these two wits, as is often the case, lived very unhappily together. They were at length totally separated, on the husband accidentally discovering a gentleman in her bedchamber at two o'clock in the morning; a circumstance which she accounted for in a very unsatisfactory manner. The story is told at large in her Memoirs; where she says, "Lovers of learning, I am sure, will pardon me, as I solemnly declare it was the attractive charms of a new book, which the gentleman would not lend me, but consented to stay till I read it through, that was the sole motive of my detaining him." As there are not wanting some who form objections to the marrying learned wives, the chance of such literary appointments may perhaps be added to the list of them. After this unlucky adventure, Mrs Pilkington came to London; and having recourse to her pen for subsistence, through the means of Colley Cibber, she lived some time on the contributions of the great. She was however thrown into the Marshalsea for debt; and being set at liberty, opened a pamphlet shop. She raised at length a handsome subscription for her Memoirs; which are written with great sprightliness and wit, containing several entertaining anecdotes of Dean Swift, with whom she was intimate, as well as many pretty little pieces of her poetry. This ingenious but unhappy woman is said at last to have killed herself with drinking, at Dublin, in 1750.

PILL, in pharmacy, a form of medicine resembling a little ball, to be swallowed whole; invented for such as cannot take bitter and ill-tasted medicinal draughts; as also to keep in readiness for occasional use without decaying. See PHARMACY, n° 854, &c.

PILLAR, in architecture. See ARCHITECTURE, n° 38.

PILLAR, in the manege, is the centre of the ring, or manege-ground, round which a horse turns, whether there be a pillar in it or not. Besides this, there are pillars on the circumference or sides of the manege-ground, placed at certain distances, by two and two, from whence they are called the *two pillars*, to distinguish them from that of the centre. The use of the pillar in the centre, is for regulating the extent of ground, that the manege upon the volts may be performed with method and justice, and that they may work in a square, by rule and measure, upon the four lines of the volts; and also to break unruly high-mettled horses, without endangering the rider. The two pillars are placed at the distance of two or three paces one from the other, and the horse is put between those, to teach him to rise before, and yerk out behind, and put himself upon raised airs, &c. either by the aids, or châtiments.

PILLORY, (*collisfrigium*, "collum stringens;" *pilloria*, from the French *pillieur*, i. e. *depeculator*, or *peloris*; derived from the Greek *πύλη*, *janua*, a "door,"

because one standing on the pillory puts his head as it were through a door; and *pecus, vides*), is an engine made of wood to punish offenders, by exposing them to public view, and rendering them infamous. There is a *statute of the pillory*, 51 Hen. III. And by statute it is appointed for bakers, forefellers, and those who use false weights, perjury, forgery, &c. 3 *Inff.* 219. Lords of leets are to have a pillory and tumbrel, or it will be the cause of forfeiture of the leet; and a vill may be bound by precription to provide a pillory, &c. 2 *Hawk.* P. C. 73.

PILOT, the officer who superintends the navigation, either upon the sea-coast or on the main ocean. It is, however, more particularly applied by our mariners to the person charged with the direction of a ship's course on or near the sea-coast, and into the roads, bays, rivers, havens, &c. within his respective district.

Pilots of ships, taking upon them to conduct any ship from Dover, &c. to any place up the river Thames, are to be first examined and approved by the master and wardens of the society of Trinity House, &c. or shall forfeit 10*l.* for the first offence, 20*l.* for the second, and 40*l.* for every other offence; one moiety to the informer, the other to the master and wardens; but any master or mate of a ship, may pilot his own vessel up the river: and if any ship be lost through the negligence of any pilot, he shall be for ever after disabled to act as a pilot. 3 Geo. I. c. 13. Also the Lord Warden of the Cinque Ports may make rules for government of pilots, and order a sufficient number to ply at sea to conduct ships up to the Thames: 7 Geo. I. c. 21. No person shall act as a pilot on the Thames, &c. (except in collier ships) without a licence from the master and wardens of Trinity House at Deptford, on pain of forfeiting 20*l.* And pilots are to be subject to the government of that corporation; and pay ancient dues, not exceeding 1*s.* in the pound, out of wages, for the use of the poor thereof. Stat. 5 Geo. II. c. 20.

By the laws of France, no person shall be received as pilot, till he has made several voyages, and passed a strict examination; and after that, on his return in long voyages, he is to lodge a copy of his journal in the admiralty: and if a pilot occasion the loss of a ship, he is to pay 100 *livres* fine, and to be for ever deprived of the exercise of pilotage; and if he doth it designedly, be punished with death. *Lex Mercat.* 70, 71.

The laws of Oleron ordain, That if any pilot designedly misguide a ship, that it may be cast away, he shall be put to a rigorous death, and hung in chains: and if the lord of a place, where a ship be thus lost, abet such villains in order to have a share of the wreck, he shall be apprehended, and all his goods forfeited for the satisfaction of the persons suffering; and his person shall be fastened to a stake in the midst of his own mansion, which, being fired on the four corners, shall be burned to the ground, and he with it. *Leg. Ol.* c. 25. And if the fault of a pilot be so notorious, that the ship's crew see an apparent wreck, they may lead him to the hatches, and strike off his head; but the common law denies this hasty execution: an ignorant pilot is sentenced to pass thrice under the ship's keel, by the laws of Denmark. *Lex Mercat.* 70.

The regulations, with regard to pilots in the royal navy, are as follow: The commanders of the king's ships, in order to give all reasonable encouragement to  
fo

so useful a body of men as pilots, and to remove all their objections to his Majesty's service, are strictly charged to treat them with good usage, and an equal respect with warrant-officers.

"The purser of the ship is always to have a set of bedding provided on board for the pilots; and the captain is to order the boatswain to supply them with hammocks, and a convenient place to lie in, near their duty, and apart from the common men; which bedding and hammocks are to be returned when the pilots leave the ship.

"A pilot, when conducting one of his Majesty's ships in pilot-water, shall have the sole charge and command of the ship, and may give orders for steering, setting, trimming, or furling the sails; tacking the ship; or whatever concerns the navigation: and the captain is to take care that all the officers and crew obey his orders. But the captain is diligently to observe the conduct of the pilot; and if he judges him to behave so ill as to bring the ship into danger, he may remove him from the command and charge of the ship, and take such methods for her preservation as shall be judged necessary; remarking upon the log-book, the exact hour and time when the pilot was removed from his office, and the reasons assigned for it.

"Captains of the king's ships, employing pilots in foreign parts of his majesty's dominions, shall, after performance of the service, give a certificate thereof to the pilot, which being produced to the proper naval officer, he shall cause the same to be immediately paid; but if there be no naval-officer there, the captain of his majesty's ship shall pay him, and send the proper vouchers, with his bill, to the navy-board, in order to be paid as bills of exchange.

"Captains of his majesty's ships, employing foreign pilots to carry the ships they command into or out of foreign ports, shall pay them the rates due by the establishment or custom of the country, before they discharge them; whose receipts being duly vouched, and sent, with a certificate of the service performed, to the navy-board, they shall cause them to be paid with the same exactness as they do bills of exchange." *Regulations and Instructions of the Sea-service, &c.*

**PIMENTO**, in botany, **JAMAICA PEPPER**, or *All-spice*. See **MYRTUS**, of which it is a species.

The fruits are gathered when green, and are exposed to the sun for many days on cloths, frequently shaking and turning them till they are thoroughly dry: great care is taken that they be not wetted by the morning and evening dews; and when thus dry, they are sent over to us.

Pimento abounds with a fragrant essential oil, which is separated in great quantity in distillation, and is so heavy that it sinks in water. This spice is much used in our foods, and sometimes in medicine: it is indeed a very good aromatic, and imitates the flavour of all the rest; so that the essential oil of Jamaica pepper is frequently substituted in the room of those drawn from the more costly spices.

**PIMPINELLA**, **BURNET SAXIFRAGE**; a genus of the digynia order, belonging to the pentandria class of plants. There are seven species; the most remarkable of which are, 1. The major, or greater burnet saxifrage, growing naturally in chalky woods, and on the sides of the banks near hedges, in several parts of

England. The lower leaves of this sort are winged; the lobes are deeply sawed on their edges, and sit close to the midrib, of a dark green. The stalks are more than a foot high, dividing into four or five branches. The lower part of the stalk is garnished with winged leaves, shaped like those at the bottom, but smaller: those upon the branches are short and trifid: the branches are terminated by small umbels of white flowers, which are composed of smaller umbels or rays. The flowers have five heart-shaped petals, which turn inward, and are succeeded by two narrow, oblong, channelled seeds. 2. The anisum, or common anise, is an annual plant, which grows naturally in Egypt; but is cultivated in Malta and Spain, from whence the seeds are annually imported into Britain. The lower leaves of this plant are divided into three lobes, which are deeply cut on their edges: the stalk rises a foot and a half high, dividing into several slender branches garnished with narrow leaves, cut into three or four narrow segments, terminated by pretty large loose umbels, composed of smaller umbels or rays, which stand on pretty long foot-stalks. The flowers are small, and of a yellowish white; the seeds are oblong and swelling.—The former species requires no culture; the latter is too tender to be cultivated for profit in this country. However, the seeds will come up if sown, in the beginning of April, upon a warm border. When they come up, they should be thinned, and kept clear of weeds; which is all the culture they require.

**USES.** Both these spices are used in medicine. The roots of pimpinella have a grateful, warm, very pungent taste, which is entirely extracted by rectified spirit: in distillation the menstruum arises, leaving all that it had taken up from the root united into a pungent aromatic resin. This root promises, from its sensible qualities, to be a medicine of considerable utility, though little regarded in common practice: the only official composition in which it is an ingredient is the *pulvis ari compositus*. Stahl, Hoffman, and other German physicians, are extremely fond of it; and recommend it as an excellent stomachic, resolvent, detergent, diuretic, diaphoretic, and alexipharmac. They frequently gave it, and not without success, in scorbutic and cutaneous disorders, foulness of the blood and juices, tumours and obstructions of the glands, and diseases proceeding from a deficiency of the fluid secretions in general. Boerhaave directs the use of this medicine in althmatic and hydropic cases, where the strongest resolvents are indicated: the form he prefers is a watery infusion; but the spirituous tincture possesses the virtues of the root in much greater perfection.

Aniseeds have an aromatic smell, and a pleasant warm taste, accompanied with a degree of sweetness. Water extracts very little of their flavour, rectified spirit the whole.

Their seeds are in the number of the four greater hot seeds: their principal use is in cold stultid disorders, where tenacious phlegm abounds, and in the gripes to which young children are subject. Frederic Hoffman strongly recommends them in weakness of the stomach, diarrhoeas, and for strengthening the tone of the viscera in general; and thinks they well deserve the appellation given them by Helmont, *intestini*

Pin,  
Pindar.

*norum folamen.* The smaller kind of anifeeds brought from Spain are preferred.

PIN, in commerce, a little necessary instrument, made of brads wire, chiefly used by women in adjusting their dress.

The perfection of pins consists in the stiffness of the wire and its smoothness, in the heads being well turned, and in the fineness of the points. The London pointing and whitening are in most repute; because the pin-makers in that city, in pointing, use two steel mills; one of which forms the point, and the other takes of all irregularities, and renders it smooth and as it were polished. In whitening, they use block-tin granulated; whereas in other countries they are said to use a mixture of tin, lead, and quicksilver. The consumption of pins is incredible, and there is no commodity sold cheaper. The number of hands employed in this manufacture is very great, each pin passing through the hands of six different workmen, between the drawing of the brads wire and the sticking of the pin in the paper.

PIN (Lewis Ellices du), a very learned French writer, was born at Paris in 1657. In 1685 he undertook to publish an universal *bibliothèque* of all the ecclesiastical writers, containing the history of their lives, &c.; which vast design he accordingly accomplished. The freedom our author used in his judgments on the style, character, and doctrine of the ecclesiastical writers, having displeased some persons, it was complained of to the archbishop of Paris, who published a decree or *ordonnance* against it. To this decree was annexed Mr du Pin's retraction; notwithstanding which, his work was suppressed by an arrest of parliament. However, he continued it under another title. His many different books shew his prodigious readiness in composing. He was at the same time a divine, canonist, historian, critic, and philosopher. At last being exhausted by his labours, and by a regimen which contributed to shorten his days, he died in 1719.

PINDAR, the prince of lyric poets, was born at Thebes, about 520 years B. C. He received his first musical instructions from his father, who was a flute-player by profession; after which, according to Suidas, he was placed under Myrtis, a lady of distinguished abilities in lyric poetry. It was during this period that he became acquainted with the poetess Corinna, who was likewise a student under Myrtis. Plutarch tells us, that Pindar profited from the lessons which Corinna, more advanced in her studies, gave him at this school. It is very natural to suppose, that the first poetical effusions of a genius so full of fire and imagination as that of Pindar would be wild and luxuriant; and Lucian has preserved six verses, said to have been the exordium of his first essay; in which he crowded almost all the subjects for song which ancient history and mythology then furnished. Upon communicating this attempt to Corinna, she told him, smiling, that he should sow with the hand, and not empty his whole sack at once. Pindar, however, soon quitted the leading-strings of these ladies, his poetical nurses, and became the disciple of

Simonides, now arrived at extreme old age; after which he soon surpassed all his masters, and acquired great reputation over all Greece: but, like a true prophet, he was less honoured in his own country than elsewhere; for at Thebes he was frequently pronounced to be vanquished, in the musical and poetical contests, by candidates of inferior merit.

The custom of having these public trials of skill in all the great cities of Greece was now so prevalent, that but little fame was to be acquired by a musician or poet, any other way than by entering the lists; and we find, that both Myrtis and Corinna publicly disputed the prize with him at Thebes. He obtained a victory over Myrtis, but, was vanquished five different times by Corinna. The judges, upon occasions like these, have been frequently accused of partiality or ignorance, not only by the vanquished, but by posterity: and if the merit of Pindar was pronounced inferior to that of Corinna five several times, it was, says Pausanias, because the judges were more sensible to the charms of beauty than to those of music and poetry (A). Was it not strange, said the Scythian Anacharsis, that the Grecian artists were never judged by artists, their peers?

Pindar, before he quitted Thebes, had the vexation to see his Dithyrambs traduced, abused, and turned into ridicule, by the comic poets of his time; and Athenæus tells us, that he was severely censured by his brother lyrics, for being a lipogrammatist, and composing an ode from which he had excommunicated the letter S. Whether these censures proceeded from envy, or contempt, cannot now be determined; but they were certainly useful to Pindar, and it was necessary that he should be lashed for such puerilities. Thebes seems to have been the *purgatory* of our young bard; when he quitted that city, as his judgment was matured, he avoided most of the errors for which he had been chastised, and suddenly became the wonder and delight of all Greece. Every hero, prince, and potentate, desirous of lasting fame, courted the Muse of Pindar.

He seems frequently to have been present at the four great festivals, of the Olympian, Pythian, Nemean, and Isthmian games, as may be inferred from several circumstances and expressions in the odes, which he composed for the victors in them all. Those at Olympia, who were ambitious of having their achievements celebrated by Pindar, applied to him for an ode, which was first sung in the Prytæneum, or town-hall of Olympia, where there was a banqueting room, set apart for the entertainment of the conquerors. Here the ode was rehearsed by a chorus, accompanied by instruments. It was afterwards performed in the same manner at the triumphal entry of the victor into his own country, in processions, or at the sacrifices that were made with great pomp and solemnity on the occasion.

Pindar, in his second Isthmian ode, has apologized for the mercenary custom among poets, of receiving money for their compositions. "The world (says he) is grown interested, and thinks in general with the Spartan philosopher Aristodemus, that money only makes

(A) Pausanias says, that Corinna was one of the most beautiful women of her time, as he judged by a picture of her, which he saw at Tanagra, in the place where the public exercises were performed. She was represented with her head ornamented by a riband, as a memorial of the victories she had obtained over Pindar at Thebes.

Pindar. *makes the man : a truth which this sage himself experienced, having with his riches lost all his friends."* It is supposed that Pindar here alludes to the avarice of Simonides, who first allowed his muse to sell her favours to the highest bidder.

There is no great poet in antiquity, whose moral character has been less censured than that of Pindar. Plutarch has preserved a single verse of his *Epicidium*, or *Dirge*, that was sung at his funeral; which, short and simple as it is, implies great praise: *This man was pleasing to strangers, and dear to his fellow-citizens. His works abound with precepts of the purest morality: and it does not appear that he ever traduced even his enemies; comforting himself, for their malignity, by a maxim which he inserted in his first Pythic, and which afterwards became proverbial, That it is better to be envied than pitied.*

Pausanias says, that the character of poet was truly consecrated, in the person of Pindar, by the God of verse himself, who was pleased, by an express oracle, to order the inhabitants of Delphos to set apart, for Pindar, one half of the first-fruit offerings brought by the religious to his shrine, and to allow him a conspicuous place in his temple; where, in an iron chair, he used to sit and sing his hymns in honour of that god. This chair was remaining in the time of Pausanias, several centuries after, and shown to him as a relic not unworthy of the sanctity and magnificence of that place.

But though Pindar's muse was pensioned at Delphos, and well paid by princes and potentates elsewhere, she seems, however, sometimes to have sung the spontaneous strains of pure friendship. Of this kind were, probably, the verses bestowed upon the musician Midas, of Agrigentum in Sicily, who had twice obtained the palm of victory by his performance on the flute at the Pythic games (8). It is in his 12th Pythic Ode, that Pindar celebrates the victory of Midas *over all Greece, upon that instrument which Minerva herself had invented* (c).

Fabrieus tells us, that Pindar lived to the age of 90; and, according to the chronology of Dr Blair, he died 435 years B.C. aged 86. His fellow-citizens erected a monument to him in the Hippodrome at Thebes, which was still subsisting in the time of Pausanias; and his renown was so great after his death, that his posterity derived very considerable honours and privileges from it. When Alexander the Great attacked the city of Thebes, he gave express orders to his soldiers to spare the house and family of Pindar. The Lacedæmonians had done the same before this period; for when they ravaged Bœotia and burned the capital, the following words were written upon the door of the poet: *Forbear to burn this house, it was the dwelling of Pindar.* Respect for the memory of this great poet continued so long, that, even in Plutarch's time, the best part of the sacred victim at the Theoxenian festival was appropriated to his descendants.

#### VOL. VIII.

(b) This Midas is a very different personage from his long-eared majesty of Phrygia, whose decision in favour of Pan had given such offence to Apollo; as is manifest, indeed, from his having been contemporary with Pindar.

(c) The most extraordinary part of this musician's performance, that can be gathered from the scholiast upon Pindar, was his finishing the solo, without a reed or mouth-piece, which broke accidentally while he was playing. The legendary account given by the poet in this ode, of the occasion upon which the flute was invented by Minerva, is diverting: "It was (says he) to imitate the howling of the Gorgons, and the hissing of their snakes, which the gods had heard when the head of Medusa (one of these three anti-graces) was cut off by Perseus."

PINDARIC ODE, in poetry, an ode formed in imitation of the manner of Pindar. See POETRY, n<sup>o</sup> 59.—61.

PINDUS, (anc. geog.), not a single mountain, but a chain of mountains, inhabited by different people of Epirus and Thessaly; separating Macedonia, Thessaly, and Epirus: An extensive chain, having Macedonia to the north, the Perrhebi to the west, the Dolopes to the south, and the mountain itself of Thessaly, (Strabo).

PINDUS, a Doric city of Ætolia, situate on the cognominal river, which falls into the Cephissus, (Strabo).

PINE, in botany. See PINUS.

PINE-Apple. See BROMELIA.

The method of raising pine-apples in this country by means of artificial heat has long been known: of late, however, some very considerable improvements have been made in this article. The leaves of the oak have been substituted to the more expensive bark; and by treating the pines with them, they are found to thrive as well, and to produce as good fruit, as in the other method; and of the proper way of managing these leaves for the rearing of exotic plants, an account is given under the article OAK-LEAVES. But the most considerable improvement is that mentioned in the 67th volume of the Philosophical Transactions, where a method is shown by William Baillart, esq; of Devonshire, of raising these fruits in water. His account of this method is as follows.

"Before I enter into the particulars of raising pine-apples in water, it will be necessary to tell you that my hot-house is covered with the best crown-glass, which I apprehend gives more heat than the common sort of green glass generally used for hot-houses. In the front part of the house, and indeed any where in the lowest parts of it, the pine-apple plants will not thrive well in water. The way in which I treat them is as follows. I place a shelf near the highest part of the back wall, so that the pine-plants may stand without absolutely touching the glass, but as near it as can be: on this shelf I place pans full of water, about seven or eight inches deep; and in these pans I put the pine-apple plants, growing in the same pots of earth as they are generally planted in to be plunged into the bark-bed in the common way; that is, I put the pot of earth, with the pine-plant in it, in the pan-full of water, and as the water decreases I constantly fill up the pan. I place either plants in fruit, or young plants as soon as they are well rooted, in these pans of water, and find they thrive equally well: the fruit reared this way is always much larger, as well as better flavoured, than when ripened in the bark-bed. I have more than once put only the plants themselves without any earth, I mean after they had roots, into these pans of water, with only water sufficient to keep the roots always covered, and found them flourish beyond expectation. In my house, the shelf I mention is supported by irons from the top, and there is an intervening

34 U

vening

Pindaric  
Pine.

Pina  
||  
Pinguicula.

vening space of about 10 inches between the back wall and the shelf. A neighbour of mine has placed a leaden cistern upon the top of the back flue, (in which, as it is in contact with the flue, the water is always warm when there is fire in the house), and finds his fruit excellent and large. My shelf does not touch the black flue, but is about a foot above it; and consequently the water is only warmed by the air in the house. Both these methods do well. The way I account for this success is, that the warm air always ascending to the part where this shelf is placed, as being the highest part of the house, keeps it much hotter than in any other part. The temperature at that place is, I believe, seldom less than what is indicated by the 73d degree of Fahrenheit's thermometer, and when the sun shines it is often at above 100: the water the plants grow in seems to enable them to bear the greatest heat, if sufficient air be allowed; and I often see the roots of the plants growing out of the holes in the bottom of the pot of earth, and shooting vigorously in the water.

"My hot-house (the dimensions of which it may be proper to know) is 60 feet long, and 11 feet wide, the flues included; six feet high in the front, and 11 feet at the back of the inside of the house. It is warmed by two fires. A leaden trough or cistern on the top of the back flue is preferable to my shelf, as in it the pine-plants grow much faster in the winter, the water being always warmed by the flue: of this I have seen the great benefit these last two months in my neighbourhood. It is not foreign to this purpose to mention, that, as a person was moving a large pine-plant from the hot-bed in my house last summer, which plant was just showing fruit, by some accident he broke off the plant just above the earth in which it grew, and there was no root whatever left to it: by way of experiment I took the plant, and fixed it upright in a pan of water (without any earth whatever) on the shelf; it there soon threw out roots, and bore a pine-apple that weighed upwards of two pounds."

PINEAL GLAND. See ANATOMY, n° 397, c.

PINGUICULA, BUTTERWORT; a genus of the monogynia order, belonging to the diandria class of plants. There are four species; of which the most remarkable is the vulgaris, or common butterwort, growing commonly on bogs or low moist grounds, in England and Scotland. Its leaves are covered with soft, upright pellucid prickles, secreting a glutinous liquor. The flowers are pale red, purple, or deep violet colour, and hairy within. If the fresh-gathered leaves of this plant are put into the strainer through which warm milk from the cow is poured, and the milk set by for a day or two to become accecent, it acquires a consistency and tenacity, and neither whey nor cream separate from it. In this state it is an extremely grateful food, and as such is used by the inhabitants of the north of Sweden. There is no further occasion to have recourse to the leaves; for half a spoonful of this prepared milk, mixed with fresh warm milk, will convert it to its own nature, and this again will change another quantity of fresh milk, and so on without end. The juice of the leaves kills lice; and the common people use it to cure the cracks or chops in cows' udders. The plant is generally supposed injurious to

sheep, by occasioning in them that disease called the rot. But from experiments made on purpose, and conducted with accuracy, it appears, that neither sheep, cows, goats, horses, or swine, will feed upon this plant.

PINION, in mechanics, an arbor, or spindle, in the body whereof are several notches, which catch the teeth of a wheel that serves to turn it round, or it is a lesser wheel that plays in the teeth of a larger.

PINK, a name given to a ship with a very narrow stern; whence all vessels, however small, whose sterns are fashioned in this manner, are called pink-sterned.

PINK, in botany. See DIANTHUS.

PINNA, in zoology, a genus belonging to the or-plate  
der of vermes testacea. The animal is a slug. The CCXLIII.  
shell is bivalve, fragile, and furnished with a beard; fig. 2.  
gapes at one end; the valves hinge without a tooth.  
The largest and most remarkable species inhabits the  
Mediterranean. It is blind, as are all of the genus;  
but furnished with very strong calcareous valves. The  
scuttle-fish (*Sepia*), an inhabitant of the same sea, is a  
deadly foe to this animal: As soon as the pinna opens its  
shell, he rushes upon her like a lion; and would always  
devour her, but for another animal whom the protecta  
within her shell, and from whom in return he re-  
ceives very important services. It is an animal of the  
crab kind, (see CANCER, n° 15.), naked like the her-  
mit, and very quick-sighted. This cancer or crab the  
pinna receives into her covering; and when she opens  
her valves in quest of food, lets him out to look for  
prey. During this the scuttle-fish approaches; the  
crab returns with the utmost speed and anxiety to his  
hostess, who being thus warned of the danger shuts  
her doors, and keeps out the enemy. That very fa-  
gacious observer Dr Hasselquist, in his voyage towards  
Palestine, beheld this curious phenomenon, which tho'  
well known to the ancients had escaped the moderns.  
Aristotle (*Hist. lib. 5. c. 15.*) relates, that the pinna  
kept a guard to watch for her: That there grew to the  
mouth of the pinna a small animal, having claws, and  
serving as a caterer, which was like a crab, and was  
called the *pinnaephylax*. Pliny (*lib. 9. 51.*) says, The  
smallest of all the kinds is called the *pinnoterus*, and  
therefore liable to injury; this has the prudence to  
hide itself in the shells of oysters. Again, *lib. 9. 66.*  
he says, The pinna is of the genus of shell-fish; it is  
produced in muddy waters, always erect, nor ever  
without a companion, which some call the *pinnoterus*,  
others the *pinnaephylax*. This sometimes is a small squill,  
sometimes a crab, that follows the pinna for the sake  
of food. The pinna is blind; and when, upon opening  
its shell, it exposes itself as a prey to the smallest kind  
of fishes, these immediately assault her, and growing  
bolder upon finding no resistance venture in. The  
guard watching its time gives notice by a bite; upon  
which the pinna, closing its shell, shuts in, kills, and  
gives part of whatever happens to be there to its com-  
panion.

The pinna and the crab together dwell,

For mutual succour, in one common shell.

They both to gain a livelihood combine;

That takes the prey, when this has given the sign.

From hence this crab, above his fellows fam'd,

By ancient Greeks was *pinnoterus* nam'd.

OPPIAN.

PINNACE, a small vessel navigated with oars and  
sails,

Pinion  
||  
Pinnacle.

**Pinnacle** fails, and having generally two masts, which are rigged like those of a schooner.

**Pinnace**, is also a boat usually rowed with eight oars. See the article **BOAT**.

**PINNACLE**, in architecture, the top or roof of an house, terminating in a point. This kind of roof among the ancients, was appropriated to temples; their ordinary roofs were all flat, or made in the platform way.

**PINNATED LEAVES**, in botany. See **BOTANY**, p. 1296. col. 2. n° 59.

**PINT**, (*pinta*), a vessel, or measure, used in estimating the quantity of liquids, and even sometimes of dry things.—Budeus derives the word from the Greek *πινδα*; others from the German *pint*, a little measure of wine; Nicod from the Greek *πινω*, “to drink.”

The *English pint* is twofold; the one for wine-measure, the other for beer and ale-measure. See **MEASURE**.—Two pints make a quart, two quarts a pottle, two pottles a gallon, &c. See **GALLON**, **QUART**, &c.

The *Scots pint* was formerly regulated by a standard jug of cast metal, the caldroy of which was committed to the borough of Stirling. This jug was supposed to contain 105 cubic inches; and though after several careful trials it has been found at a medium to contain only about 103½ inches, yet, in compliance with established custom, founded on that opinion, the pint-stoups are still regulated to contain 105 inches.—It was enacted by James I. of Scotland, that the pint should contain 41 ounces Trone-weight of the clear water of Tay, and by James VI. that it should contain 55 Scots Troy-ounces of the clear water of Leith. This affords another method of regulating the pint, and also ascertains the ancient standard of the Trone-weight. As the water of Tay and Leith are alike, the Trone-weight must have been to the Scots Troy-weight as 55 to 41; and therefore the pound Trone must have contained about 21½ ounces Scots Troy. See **TRONE**.—The Scots pint contains two chopins, the chopin two mutchkins, and the mutchkin four gills.—Two pints make a quart, and four pints a Scots gallon.

**PINTADA**, a species of **PROCELLARIA**.

**PINTLES**, certain pints or hooks, fastened upon the back part of the rudder, with their points downwards, in order to enter into, and rest upon, the *goings*, fixed in the stern-post, to hang the rudder. See **HELM**.

**PINTURICCIO** (Bernardino), a celebrated Italian painter, born at Perugia in 1454. He was the disciple of Peter Perugino, under whom he became so good an artist, that he employed him on many occasions as his assistant. He principally painted history and grotesque; but he also excelled in portraits, among which those of pope Pius II. and Innocent VIII. of Giulia Farnese, Cesar Borgia, and queen Isabella of Spain, are particularly distinguished. The most memorable performance of Pinturiccio is the history of Pius II. painted in ten compartments in the history of Siena; in which undertaking, Raphael, then a young man, and bred under the same master, assisted him so far as to sketch out cartoons of many parts of the composition. The story of his death is worth relating, especially as it illustrates his character. The last work

he was engaged in was a *Nativity* for the monastery of St Francis at Siena: the monks accommodated him with a chamber to work in, which they cleared of all the furniture, except one old trunk or chest that appeared too rotten to move; but Pinturiccio, naturally positive and peevish, insinuating on its being taken away, the monks, willing to gratify him, complied. It was no sooner stirred than one of the planks bursting, out tumbled 500 pieces of gold, which had been secreted there for many years. The monks were overjoyed at finding this treasure, and the painter proportionably mortified at losing his chance of the discovery by his indiscreet obtuseness: it affected his spirits so much that he survived but a few months, and it was generally looked on as the cause of his death.

**PINUS**, the **PINE-TREE**; a genus of the monadelphia order, belonging to the monœcia class of plants. There are 14 species; of which the most remarkable are, 1. The pinea, pineaster, or wild pine, grows naturally on the mountains in Italy and the south of France. This grows to the size of a large tree; the branches extend to a considerable distance; and while the trees are young, they are fully garnished with leaves, especially where they are not so close as to exclude the air from those within; but as they advance in age, the branches appear naked, and all those which are situated below become unsightly in a few years, for which reason they are now much less in esteem than formerly. 2. The rubra, commonly called the *Scots fir* or *pine*. It is common throughout Scotland, whence its name; though it is also found in most of the other countries of Europe. M. du Hamel, of the Royal Academy of Sciences, mentions his having received some seeds of it from St Domingo in the West Indies; and thence concludes, that it grows indifferently in the temperate, frigid, and torrid zones. The wood of this tree is the red or yellow deal, which is the most durable of any of the kinds yet known. The leaves of this tree are much shorter and broader than those of the former sort, of a greyish colour, growing two out of one sheath; the cones are small, pyramidal, and end in narrow points; they are of a light colour, and the seeds are small. 3. The *strobus*, Lord Weymouth's pine, or North American white pine. This grows sometimes to the height of 100 feet and upwards, and is highly valued on account of its beauty. The bark of the tree is very smooth and delicate, especially when young; the leaves are long and slender, five growing out of one sheath; the branches are pretty closely garnished with them, and thus make a fine appearance. The cones are long, slender, and very loose, opening with the first warmth of the spring; so that if they are not gathered in winter, the scales open and let out the seeds. The wood of this sort is esteemed for making masts for ships. In Queen Anne's time there was a law made for the preservation of these trees, and for the encouragement of their growth in America. Within these last 50 years they have been propagated in Britain in considerable plenty.

**Culture**. All the sorts of pines are propagated by seeds produced in hard woody cones. The way to get the seeds out of these cones is to lay them before a gentle fire, which will cause the cells to open, and then the seeds may be easily taken out. If the cones

*Pinus*. are kept entire, the seeds will remain good for some years; so that the surest way of preserving them is to let them remain in the cones till the time for sowing the seeds. If the cones are kept in a warm place in summer, they will open and emit the seeds; but if they are not exposed to the heat, they will remain close for a long time. The best season for sowing the pines is about the end of March. When the seeds are sown, the place should be covered with nets to keep off the birds; otherwise, when the plants begin to appear with the hulk of the seed on the top of them, the birds will peck off the 'tops, and thus destroy them.

*Uses*. From the first species is extracted the common turpentine, much used by farriers, and from which is drawn the oil of that name. A decoction of the nuts or seeds of this species in milk, or of the extremities of the branches pulled in spring, is said, with a proper regimen, to cure the most inveterate scurvy. The wood of this species is not valued; but that of the Scots pine is superior to any of the rest. It is observable of the Scots pine, that when planted in bogs, or in a moist soil, though the plants make great progress, yet the wood is white, soft, and little esteemed; but when planted in a dry soil, tho' the growth of the trees is there very slow, yet the wood is proportionally better. Few trees have been applied to more uses than this. The tallest and straightest are formed by nature for masts to our navy. The timber is refinous, durable, and applicable to numberless domestic purposes, such as flooring and wainscoting of rooms, making of beds, chests, tables, boxes, &c. From the trunk and branches of this, as well as most others of the pine tribe, tar and pitch is obtained. By incision, barras, Burgundy pitch, and turpentine, are acquired and prepared. The refinous roots are dug out of the ground in many parts of the Highlands, and, being divided into small splinters, are used by the inhabitants to burn instead of candles. At Loch-Broom, in Ross-shire, the fishermen make ropes of the inner bark; but hard necessity has taught the inhabitants of Sweden, Lapland, and Kamtschatka, to convert the same into bread. To effect this, they, in the Spring season, make choice of the tallest and fairest trees; then stripping off carefully the outer bark, they collect the soft, white, succulent interior bark, and dry it in the shade. When they have occasion to use it, they first toast it at the fire, then grind, and, after steeping the flour in warm water to take off the refinous taste, they make it into thin cakes, which are baked for use. On this strange food the poor inhabitants are sometimes constrained to live for a whole year; and, we are told, through custom, become at last even fond of it. Linnæus remarks, that this same bark-bread will fatten swine; and humanity obliges us to wish, that men might never be reduced to the necessity of robbing them of such a food. The interior bark, of which the above-mentioned bread is made, the Swedish boys frequently peel off the trees in the Spring, and eat raw with greedy appetite. From the cones of this tree is prepared a diuretic oil, like the oil of turpentine, and a refinous extract, which has similar virtues with the balsam of Peru. An infusion or tea of the buds is highly commended as an antiscorbutic. The farina,

or yellow powder, of the male-flowers, is sometimes in the spring carried away by the winds, in such quantities, where the trees abound, as to alarm the ignorant with the notion of its raining brimstone. The tree lives to a great age; Linnæus affirms, to 400 years.

PIONEERS, in the art of war, are such as are commanded in from the country, to march with an army for mending the ways, for working on intrenchments and fortifications, and for making mines and approaches. The soldiers are likewise employed in all these things.—Most of the foreign regiments of artillery have half a company of pioneers, well instructed in that important branch of duty. Our regiments of infantry and cavalry have three or four pioneers well instructed in that important branch of duty. Our regiments of infantry and cavalry have three or four pioneers each, provided with aprons, hatchets, saws, spades, and pick-axes. Each pioneer must have an ax, a saw, and an apron; a cap with a leather crown, and a black bears-skin front, on which is to be the king's crest in white, on a red ground; also an ax and a saw. The number of the regiment to be on the back part of the cap.

PIP, or PAP, a disease among poultry, consisting of a white thin skin, or film, that grows under the tip of the tongue, and hinders their feeding. It usually arises from want of water, or from the drinking puddle-water, or eating filthy meat. It is cured by pulling off the film with the fingers, and rubbing the tongue with salt. Hawks are particularly liable to this disease, especially from feeding on stinking flesh.

PIPE, in building, &c. a canal, or conduit, for the conveyance of water and other liquids. Pipes for water, water-engines, &c. are usually of lead, iron, earth, or wood: the latter are usually made of oak or elder. Those of iron are cast in forges; their usual length is about two feet and a half: several of these are commonly fastened together by means of four screws at each end, with leather or old hat between them, to stop the water. Those of earth are made by the potters; these are fitted into one another, one end being always made wider than the other. To join them the clofer, and prevent their breaking, they are covered with tow and pitch: their length is usually about that of the iron pipes. The wooden pipes are trees bored with large iron augres, of different sizes, beginning with a less, and then proceeding with a larger successively; the first being pointed, the rest being formed like spoons, increasing in diameter, from one to six inches or more: they are fitted into the extremities of each other (as represented fig. 5.), and are sold by the foot.

Wooden pipes are bored as follows. The machine represented fig. 4. is put in motion by the wheel A, which is moved by a current of water; upon the axle of this wheel, is a cog-wheel B, which causes the lanterns C, D, to turn horizontally, whose common axis is consequently in a perpendicular direction. The lantern D turns at the same time two cog-wheels, E and F: the first, E, which is vertical, turns the augre which bores the wood; and the second, F, which is horizontal, causes the carriage bearing the piece to advance by means of the arms H, I, which takes hold of the notches in the wheel K. The first, H,

Pioneers  
||  
Pipe.

Plate  
CCXLIV.

H, by means of the notches, draws the wheel towards F; and the other, I, pushes the under-post of the wheel in an opposite direction; both which motions tend to draw the carriage towards F, and consequently cause the augre to pierce the wood. The augre being from 9 to 12 feet in length, and of a proportionable bigness, it will be necessary to have two pieces, as L, L, to support its weight, and cause it to enter the piece to be bored with the same uniformity.

For the construction of leaden pipes, see the article PLUMBERY.

*Air-Pipes.* See *Air-Pipes*.

*Pipes of an Organ.* See *ORGAN*.

*Bag-Pipe.* See *BAG-PIPE*.

*Tobacco-PIPE*, a machine used in the smoking of tobacco, consisting of a long tube, made of earth or clay, having at one end a little case, or furnace, called the *bowl*, for the reception of the tobacco, the fumes whereof are drawn by the mouth through the other end. Tobacco-pipes are made of various fashions; long, short, plain, worked, white, varnished, unvarnished, and of various colours, &c. The Turks use pipes three or four feet long, made of rushes, or of wood bored, at the end whereof they fix a kind of a pot of baked earth, which serves as a bowl, and which they take off after smoking.

*PIPE*, also denotes a vessel or measure for wine, and things measured by wine-measure. See the article MEASURE.

*PIPE*, in mining, is where the ore runs forwards endwise in a hole, and doth not sink downwards or in a vein.

*PIPE*, *Pipa*, in law, is a roll in the exchequer, called also the *great roll*. See the next article.

*PIPE-Office*, is an office wherein a person called the *clerk of the pipe*, makes out leases of crown-lands, by warrant from the lord-treasurer, or commissioners of the treasury, or chancellor of the exchequer. The clerk of the pipe makes out also all accounts of sheriffs, &c. and gives the accountants their *quietus est*. To this office are brought all accounts which pass the remembrancer's office, and remain there, that if any stated debt be due from any person, the same may be drawn down into the great roll of the pipe: upon which the comptroller issues out a writ, called the *summons of the pipe*, for recovery thereof; and if there be no goods or chattels, the clerk then draws down the debts to the lord treasurer's remembrancer, to write estreats against their lands. All tallies which vouch the payment of any sum contained in such accounts, are examined and allowed by the chief secondary of the pipe. Besides the chief clerk in this office, there are eight attorneys, or sworn clerks, and a comptroller.

*PIPE-Fish*, in ichthyology. See *SYNGNATHUS*.

*PIPER*, in ichthyology. See *TRIGLA*.

*PIPER*, *Pepper*; a genus of the trigynia order, belonging to the diandria class of plants. There are 20 species, of which the most remarkable is the *piriboa*, with oval, heart-shaped, nerved leaves, and reflexed spikes. This is the plant which produces the pepper so much used in food. It is a shrub whose root is small, fibrous, and flexible; it rises into a stem, which requires a tree or a prop to support it. Its wood has the

same sort of knots as the vine; and when it is dry, it exactly resembles the vine-branch. The leaves, which have a strong smell and a pungent taste, are of an oval shape; but they diminish towards the extremity, and terminate in a point. From the flower-buds, which are white, and are sometimes placed in the middle and sometimes at the extremity of the branches, are produced small berries resembling those of the curant-tree. Each of these contains between 20 and 30 corns of pepper; they are commonly gathered in October, and exposed to the sun seven or eight days. The fruit, which was green at first, and afterwards red, when stripped of its covering assumes the appearance it has when we see it. The largest, heaviest, and least shrivelled, is the best.

The pepper-plant flourishes in the islands of Java, Sumatra, and Ceylon, and more particularly on the Malabar coast. It is not sown, but planted; and great nicety is required in the choice of the shoots. It produces no fruit till the end of three years; but bears so plentifully the three succeeding years, that some plants yield between six and seven pounds of pepper. The bark then begins to shrink; and the shrub declines so fast, that in 12 years time it ceases bearing.

The culture of pepper is not difficult: it is sufficient to plant it in a rich soil, and carefully to pull up the weeds that grow in great abundance round its roots, especially the three first years. As the sun is highly necessary to the growth of the pepper-plant, when it is ready to bear, the trees that support it must be lopped to prevent their shade from injuring the fruit. When the season is over, it is proper to crop the head of the plant. Without this precaution, there would be too much wood, and little fruit.

The pepper exported from Malabar, which was formerly entirely in the hands of the Portuguese, and is at present divided between the Dutch, British, and French, amounts to about 10,000,000 weight.

*PIRÆUS PORTUS*, (anc. geog.), a celebrated port to the west of Athens, consisting naturally of three harbours or basons, (Thucydides); which lay neglected, till Themistocles put the Athenians on making it a commodious port, (Nepos); the Phalerus a small port, and not far from the city, being what they used before that time, (Pausanias, Nepos). Piræus was originally a village of Attica, (Pausanias); an island, (Strabo); and though distant 40 stadia from Athens, was joined to it by two long walls, (Thucydides), and itself locked or walled round, (Nepos): A very commodious and safe harbour. The whole of its compass was 60 stadia, including the Munichia. Not far from the Piræus, stood the sepulchre of Themistocles; whither his friends conveyed his bones from Magnesia, into the Hither Asia, (Cicero, Plutarch, Pausanias). It is still at this day a famous port, much frequented, and called *Porto Leone*.

*PIRACY*, the crime of robbery and depredation upon the high seas.

By the ancient common law, piracy, if committed by a subject, was held to be a species of treason, being contrary to his natural allegiance; and by an alien, to be felony only: but now, since the statute of treasons, 25 Edw. III. c. 2. it is held to be only felony in a subject. Formerly it was only cognizable by the admiralty courts, which proceed by the rules of the civil

Piracy,  
Pirate.

civil law. But, it being inconsistent with the liberties of the nation, that any man's life should be taken away, unless by the judgment of his peers, or the common law of the land, the statute 28 Hen. VIII. c. 15. established a new jurisdiction for this purpose; which proceeds according to the course of the common law.

The offence of piracy, by common law, consists in committing those acts of robbery and depredation upon the high seas, which, if committed upon land, would have amounted to felony there. But, by statute, some other offences are made piracy also: as, by statute 11 & 12 W. III. c. 7. if any natural born subject commits any act of hostility upon the high seas, against others of his majesty's subjects, under colour of a commission from any foreign power; this, though it would only be an act of war in an alien, shall be construed piracy in a subject. And farther, any commander, or other seafaring person, betraying his trust, and running away with any ship, boat, ordnance, ammunition, or goods; or yielding them up voluntarily to a pirate; or conspiring to do these acts; or any person assaulting the commander of a vessel, to hinder him from fighting in defence of his ship; or confining him, or causing or endeavouring to cause a revolt on board; shall, for each of these offences, be adjudged a pirate, felon, and robber, and shall suffer death, whether he be principal, or merely accessory by setting forth such pirates, or abetting them before the fact, or receiving or concealing them or their goods after it. And the statute 4 Geo. I. c. 11. expressly excludes the principals from the benefit of clergy. By the statute 8 Geo. I. c. 24. the trading with known pirates, or furnishing them with ammunition, or fitting out any vessel for that purpose, or in any wise consulting, combining, confederating, or corresponding with them; or the forcibly boarding any merchant vessel, though without seizing or carrying her off, and destroying or throwing any of the goods overboard; shall be deemed piracy: and such accessories to piracy as are described by the statute of king William are declared to be principal pirates, and all pirates convicted by virtue of this act are made felons without benefit of clergy. By the same statutes also, (to encourage the defence of merchant vessels against pirates), the commanders or seamen wounded, and the widows of such seamen as are slain, in any piratical engagement, shall be entitled to a bounty to be divided among them, not exceeding one fiftieth part of the value of the cargo on board: and such wounded seamen shall be entitled to the pension of Greenwich hospital; which no other seamen are, except only such as have served in a ship of war. And if the commander shall behave cowardly, by not defending the ship, if she carries guns or arms; or shall discharge the mariners from fighting, so that the ship falls into the hands of pirates; such commander shall forfeit all his wages, and suffer six months imprisonment. Lastly, by statute 18 Geo. II. c. 30. any natural born subject or denizen, who in time of war shall commit hostilities at sea against any of his fellow-subjects, or shall assist an enemy on that element, is liable to be tried and convicted as a pirate.

PIRATE, (*carpax*, Gr.); a sea-robber, or an armed ship that roams the seas without any legal

commission, and seizes or plunders every vessel she meets indiscriminately, whether friends or enemies.

The colours usually displayed by pirates are said to be a black field, with a death's head, a battle-axe, and hour-glass. The last instrument is generally supposed to determine the time allowed to the prisoners, whom they take, to consider whether they will join the pirates in their felonious combination, or be put to death, which is often perpetrated in the most cruel manner.

Amongst the most celebrated pirates of the north is recorded Alvida, daughter of a king of the Goths named *Sypardus*. She embraced this occupation to deliver herself from the violence imposed on her inclination, by a marriage with Alf, son of Sigarus king of Denmark. She dressed herself as a man; and composed her band of rowers, and the rest of her crew, of a number of young women attired in the same manner. Amongst the first of her cruises, she touched at a place where a company of pirates bewailed the death of their captain. The strangers were captivated with the agreeable manners of Alvida, and chose her for their chief. By this reinforcement she became so formidable upon the sea, that prince Alf came to engage her. She sustained his attacks for a considerable time: but, in a vigorous action, Alf boarded her vessel, and having killed the greatest part of her crew, seized the captain, namely herself; whom nevertheless he knew not, because the princess had a casque which covered her visage. Being master of her person, he removed the casque; and in spite of her disguise, instantly recognized her, and offered her his hand in wedlock.

PIRENE, (Pliny); a fountain sacred to the muses, springing below the top of the Acrocorinthus, a high and steep mountain which hangs over Corinth. Its waters were agreeable to drink, (Pausanias); extremely clear, (Strabo); very light (Athenaeus), and pale (Persius): having relation either to the grief of Pirene, mother of Cenchrea, from whose tears this fountain arose, (Pausanias); or to the paleness brought on by the too eager pursuits of the muses.

PISA, a large town of Tuscany in Italy, situated on the river Arno, 52 miles from Florence. It was a famous republic, till subdued, first by the duke of Milan, and then by the Florentines in the year 1406. Before it lost its freedom, it is said to have contained near 150,000 inhabitants, but now it has not above 16,000 or 17,000. Its territory is very fruitful; abounding in corn, wine, and fruit, and fine cattle. The houses are well built, and the streets even, broad, and well paved; but in many places over-run with grass. The university is well endowed, and has able professors, but is not in a very flourishing condition. The exchange is a stately structure, but little frequented. The great duke's galleys are built, and commonly stationed here. This city is also the principal residence of the order of St Stephen, and the see of an archbishop. The cathedral, a large Gothic pile, contains a great number of excellent paintings and other curiosities. The echo of the Baptistry is said to exceed that near Milan, though the repetitions are not quite so distinct. Hard by the cathedral is the city burying ground, called *Il Campo Santo*; and in that the famous leaning tower, the inclination of which

Pirene  
Pisa.

which is so great, that a plumb-line let down from the top touches the ground at the distance of near 15 feet from the bottom. In the church della Spina, they pretend to have one of the thorns of the crown that was placed on our Saviour's head. The city for its defence has a moat, walls, a castle, fort, and citadel; the last of which is a modern work. The Arno is of a considerable breadth here, and has three bridges over it, one of them of marble: two leagues below the town, it falls into the sea. The phycic garden is very spacious, contains a great number of plants, and is decorated with water-works: over the door leading into it are these words, *Hic Argus sed non Briareus esto*; i. e. Employ the eye of Argus, but not the hands of Briareus. The air is said to be unwholesome here in summer, on account of the neighbouring morasses. Many buffaloes are bred in the neighbouring country, and their flesh commonly eaten. A canal runs from this city to Leghorn; and between it and Lucca are hot baths.

PISCARY, in our ancient statutes, the liberty of fishing in another man's waters.

PISCES, in astronomy, the 12th sign or constellation of the zodiac.

PISCIDIA, a genus of the decandria order, belonging to the diadelphia class of plants. There are two species, viz. 1. The erythrina, or dog-wood tree. This grows plentifully in Jamaica, where it rises to the height of 25 feet or more; the stem is almost as large as a man's body, covered with a light-coloured smooth bark, and sending out several branches at the top without order; the leaves are about two inches long, winged, with oval lobes. The flowers are of the butterfly kind, and of a dirty white colour; they are succeeded by oblong pods, with four longitudinal wings, and jointed between the cells which contain the seeds. 2. The Carthaginienfis, with oblong oval leaves, is also a native of the West Indies. It differs from the former only in the shape and consistence of the leaves, which are more oblong and stiffer than the former; but in other respects they are very similar. Both species are easily propagated by seeds; but require artificial heat to preserve them in this country.—The negroes in the West Indies make use of the bark of the first species to intoxicate fish. When any number of gentlemen have an inclination to divert themselves with fishing, or, more properly speaking, with fish-hunting, they send each of them a negro-slave to the woods, in order to fetch some of the bark of the dog-wood tree. This bark is next morning pounded very small with bones, put into old sacks, carried into rocky parts of the sea, steeped till thoroughly soaked with salt-water, and then well squeezed by the negroes to express the juice. This juice immediately colours the sea with a reddish hue; and, being of a poisonous nature, will in an hour's time make the fishes, such as groopers, rock-fish, old wives, Welchmen, &c. so drunk or intoxicated, as to swim on the surface of the water, quite heedless of the danger: the gentlemen then send in their negroes, who pursue, both swimming and diving, the poor inebriated fishes, till they catch them with their hands; their masters mean time standing by, on high rocks, to see the pastime.

It is remarkable, that though this poison kills millions of the small fry, it has never been known to im-

part any bad quality to the fish which have been caught in consequence of the intoxication.

The wood of this tree, although pretty hard, is only fit for fuel; and even for this purpose the negroes very seldom, if ever, employ it, on account of its singular quality just mentioned. The bark is rough, brown, and thick; the tree sends forth a considerable number of branches, and is well clothed with leaves, which resemble those of the pea, are thick, cottony, and of a deep green. The bark used for the above-mentioned purpose is chiefly that of the roots.

PISCINA, in antiquity, a large basin in a public place or square, where the Roman youth learned to swim; and which was surrounded with a high wall, to prevent filth from being thrown into it.—This word is also used for a lavatory among the Turks, placed in the middle court of a mosque or temple, where the Mussulmen wash themselves before they offer their prayers.

PISISTRATUS, a famous general of the Athenians. He usurped the supreme power, and, in order to obtain it, was a cruel tyrant; but having gained it, he became a wise legislator, and an excellent governor. He died 327 B. C.

PISSAPHALTUM, EARTH-PITCH; a fluid, opaque, mineral body, of a thick consistence, strong smell, readily inflammable, but leaving a residuum of greyish ashes after burning. It arises out of the cracks of the rocks, in several places in the island of Sumatra, and some other places in the East Indies, where it is much esteemed in paralytic disorders.

PISELEUM INDICUM, *Barbadoes Tar*; a mineral fluid, of the nature of the thicker bitumens, and of all others the most approaching, in appearance, colour, and consistence, to the true pissaphaltum, but differing from it in other respects. It is very frequent in many parts of America, where it is found trickling down the sides of mountains in large quantities, and sometimes floating on the surface of the waters. It has been greatly recommended internally in coughs, and other disorders of the breast and lungs.

PISTACIA, TURPENTINE-TREE, *Pistachia-nut* and *Mastic tree*; a genus of the pentandria order, belonging to the dioecia class of plants. There are nine species; of which the most remarkable are, 1. The cerebinthus, or pistachia-tree. This grows naturally in Arabia, Persia, and Syria, whence the nuts are annually brought to Europe. In those countries it grows to the height of 25 or 30 feet; the bark of the stem and old branches is of a dark russet colour, but that of the young branches is of a light brown. These are garnished with winged leaves, composed sometimes of two, at other times of three pair of lobes, terminated by an odd one: these lobes approach towards an oval shape, and their edges are turned backward; and these, when bruised, emit a smell similar to that of the shell of the nut. Some of these trees produce male, and others female flowers, and some have both male and female on the same tree. The male flowers come out from the sides of the branches, in loose bunches or catkins. They have no petals, but five small stamina crowned by large four-cornered summits filled with farina; and when this is discharged, the flowers fall off. The female flowers come out in clusters from the sides of the branches: they have no petals, but a large oval germen supporting three reflexed styles, and are succeeded by oval nuts.

Pistacia  
Pisum.

nuts. 2. The lentiscus, or common mastic-tree, grows naturally in Portugal, Spain, and Italy. Being an evergreen, it has been preserved in this country in order to adorn the green-houses. In the countries where it is a native, it rises to the height of 18 or 20 feet, covered with a grey bark on the stem; but the branches, which are very numerous, are covered with a reddish-brown bark, and are garnished with winged leaves, composed of three or four pair of small spear-shaped lobes, without an odd one at the end. 3. The orientalis, or true mastic-tree of the Levant, from which the mastic is gathered, has been confounded by most botanical writers with the lentiscus, or common mastic-tree, above described, though there are considerable differences between them. The bark of the tree is brown; the leaves are composed of two or three pair of spear-shaped lobes, terminated by an odd one: the outer lobes are the largest; the others gradually diminish, the innermost being the least. These turn of a brownish colour towards the autumn, when the plants are exposed to the open air; but if they are under glasses, they keep green. The leaves continue all the year; but are not so thick as those of the common sort, nor are the plants so hardy.

*Culture.* The first species is propagated by its nuts; which should be planted in pots filled with light kitchen-garden earth, and plunged into a moderate hot-bed to bring up the plants: when these appear, they should have a large share of air admitted to them, and by degrees they should be exposed to the open air, which at last they will bear in all seasons, though not without great danger of being destroyed in severe winters. The second sort is commonly propagated by laying down the branches, though it may also be raised from the seed in the manner already directed for the pistachia-tree: And in this manner also may the true mastic-tree be raised; but this, being more tender than any of the other sorts, requires to be constantly sheltered in winter, and to have a warm situation in summer.

*Uses.* Pistachia nuts abound with a sweet and well-tasted oil, which they yield in great abundance on being pressed after bruising them: they are reckoned wholesome and nutritive; and are very proper to be prescribed by way of restoratives, eaten in small quantity, to people emaciated by long illness.

PISTIL, among botanists, the little upright column which is generally found in the centre of every flower. According to the Linnæan system, it is the female part of generation, whose office is to receive and secrete the pollen, and produce the fruit. It consists of three parts, viz. germen, stylus, and stigma.

PISTOL, the smallest piece of fire-arms, borne at the saddle-bow, on the girdle, and in the pocket.

PISTOLE, a gold coin, struck in Spain, and in several parts of Italy, Switzerland, &c.—The pistole has its augmentations and diminutions, which are quadruple pistoles, double pistoles, and half pistoles. See MONEY-Table.

PISTON, in pump-work, is a short cylinder of metal or other solid substance, fitted exactly to the cavity of the barrel or body of the pump. See HYDROSTATICS, &c. v.

PISUM, PEASE; a genus of the decandria order, belonging to the diadelphia class of plants. The species are, 1. The sativum, or greater garden-pea, whose

lower stipulæ are roundish, indented, with taper foot-stalks and many flowers on a foot-stalk. 2. The humile, or dwarf pea, with an erect branching stalk, and leaves having two pair of round lobes. 3. The umbellatum, rose, or crown-pea, with four-pointed acute stipulæ, and foot-stalks bearing many flowers, which terminate the stalks. 4. The maritimum, or sea-pea, with foot-stalks which are plain on their upper side, an angular stalk, arrow-pointed stipulæ, and foot-stalks bearing many flowers. 5. The Americanum, commonly called *Cape-Horn pea*, with an angular trailing stalk, whose lower leaves are spear-shaped, sharply indented, and those at the top arrow-pointed. 6. The ochrus, with membranaceous running foot-stalks, having two leaves and one flower upon a foot-stalk.

There is a great variety of garden pease now cultivated in Britain, which are distinguished by the gardeners and seedsmen, and have their different titles; but as great part of these have been feminal variations, so if they are not very carefully managed, by taking away all those plants which have a tendency to alter before the seeds are formed, they will degenerate into their original state: therefore all those persons who are curious in the choice of their seeds, look carefully over those which they design for seeds at the time when they begin to flower, and draw out all the plants which they dislike from the other. This is what they call *regulating their pease*; meaning hereby, the taking out all the bad plants from the good, that the farina of the former may not impregnate the latter; to prevent which, they always do it before the flowers open. By thus diligently drawing out the bad, reserving those which come earliest to flower, they have greatly improved their pease of late years, and are constantly endeavouring to get forwarder varieties; so that it would be to little purpose in this place, to attempt giving a particular account of all the varieties now cultivated: therefore we shall only mention their titles by which they are commonly known; placing them according to their time of coming to the table, or gathering for use.

The golden hotspur.	Nonpareil.
The Charlton.	Sugar dwarf.
The Reading hotspur.	Sickle pea.
Master's hotspur.	Marrowfat.
Effex hotspur.	Rose or crown pea.
The dwarf pea.	Rouncival pea.
The fugar pea.	Gray pea.
Spanish Morotto.	Pig pea; with some others.

The English sea-pea is found wild upon the shore in Suffex and several other counties in England, and is undoubtedly a different species from the common pea.

The fifth species hath a biennial root, which continues two years. This was brought from Cape Horn by Lord Anson's cook, when he passed that Cape, where these pease were a great relief to the sailors. It is kept here as a curiosity, but the pease are not so good for eating as the worst sort now cultivated in Britain. It is a low trailing plant: the leaves have two lobes on each foot-stalk: those below are spear-shaped, and sharply indented on their edges; but the upper leaves are small, and arrow-pointed. The flowers are blue, each foot-stalk sustaining four or five flowers; the pods are taper, near three inches long; and the seeds are round, about the size of tares.

The sixth sort is annual. This grows naturally among the corn in Sicily and some parts of Italy, but is here preferred in botanic gardens for the sake of variety. It hath an angular stalk rising near three feet high; the leaves stand upon winged foot-stalks, each sustaining two oblong lobes. The flowers are of a pale yellow colour, shaped like those of the other sort of pea, but are small, each foot-stalk sustaining one flower; these are succeeded by pods about two inches long, containing five or six roundish seeds, which are a little compressed on their sides. These are by some persons eaten green; but unless they are gathered very young, they are coarse, and at best not so good as the common pea. It may be sown and managed in the same way as the garden pea.

We shall now proceed to set down the method of cultivating the several sorts of garden pease, so as to continue them throughout the season.

It is a common practice with the gardeners near London, to raise pease upon hot-beds, to have them very early in the spring; in order to which, they sow their pease upon warm borders, under walls or hedges, about the middle of October; and when the plants come up, they draw the earth up gently to their stems with a hoe, the better to protect them from frost. In these places they let them remain until the latter end of January, or the beginning of February, observing to earth them up from time to time as the plants advance in height (for the reasons before given); as also to cover them in very hard frost with pease-haulm, straw, or some other light covering, to preserve them from being destroyed; then, at the time before-mentioned, they make a hot-bed (in proportion to the quantity of pease intended), which must be made of good hot dung, well prepared and properly mixed together, that the heat may not be too great. The dung should be laid for two or three feet thick, according as the beds are made earlier or later in the season; when the dung is equally levelled, then the earth (which should be light and fresh, but not over rich), must be laid thereon about six or eight inches thick, laying it equally all over the bed. This being done, the frames (which should be two feet high on the back side, and about 14 inches in front), must be put on, and covered with glasses; after which, it should remain three or four days, to let the steam of the bed pass off before you put the plants therein, observing every day to raise the glasses, to give vent for the rising steam to pass off; then, when you find the bed of a moderate temperature for heat, you should, with a trowel, or some other instrument, take up the plants as carefully as possible to preserve the earth to their roots, and plant them into the hot-bed in rows about two feet asunder, and the plants about an inch distant from each other in the rows, observing to water and shade them until they have taken root; after which you must be careful to give them air at all times when the season is favourable, otherwise they will draw up very weak, and be subject to grow mouldy and decay. You should also draw the earth up to the flanks of the plants as they advance in height, and keep them always clear from weeds. The water they should have must be given them sparingly; for if they are too much watered, it will cause them to grow too rank, and sometimes rot off the plants at their flanks just above ground. When

the weather is very hot, you should cover the glasses with mats in the heat of the day, to screen them from the violence of the heat of the sun, which is then too great for them; but when the plants begin to fruit, they should be watered oftener, and in greater plenty than before; for by that time the plants will have nearly done growing, and the often refreshing them will occasion their producing a greater plenty of fruit.

The sort of pea which is generally used for this purpose, is the dwarf; for all the other sorts ramble too much to be kept in frames: the reason for sowing them in the common ground, and afterwards transplanting them on a hot-bed, is to check their growth, and cause them to bear in less compass; for if the seeds were sown upon a hot-bed, and the plants continued thereon, they would produce such luxuriant plants as could not be contained in the frames, and would bear but little fruit.

The next sort of pea, which is sown to succeed those on the hot-bed, is the hotspur, of which there are reckoned several varieties, as the golden hotspur, the Charlton hotspur, the Masters' hotspur, the Reading hotspur, and some others; which are very little differing from each other, except in their early bearing, for which the golden and Charlton hotspurs are chiefly preferred; though if either of these sorts are cultivated in the same place for three or four years, they are apt to degenerate, and be later in fruiting; for which reason, most curious persons procure their seeds annually from some distant place; and in the choice of these seeds, if they could be obtained from a colder situation and a poorer soil than that in which they are to be sown, it will be much better than on the contrary, and they will come earlier in the spring.

These must also be sown on warm borders, toward the latter end of October; and when the plants are come up, you should draw the earth up to their flanks and treat them in every other respect as above directed.

In the spring you must carefully clear them from weeds, and draw some fresh earth up to their stems; but do not raise it too high up to the plants, lest by burying their leaves you should rot their stems, as is sometimes the case, especially in wet seasons. You should also observe to keep them free from vermin, which, if permitted to remain amongst the plants, will increase so plentifully as to devour the greatest part of them. The chief of the vermin which infest pease are slugs, which lie all the day in the small hollows of the earth, near the stems of the plants, and in the nighttime come out and make terrible destruction of the pease; and these chiefly abound in wet soils, or where a garden is neglected and over-run with weeds: therefore you should make the ground clear every way round the pease to destroy their harbours; and afterwards in a fine mild morning very early, when these vermin are got abroad from their holes, you should shake a quantity of lime, which should be strewn over the ground pretty thick, which will destroy the vermin wherever it happens to fall upon them, but will do very little injury to the pease, provided it be not scattered too thick upon them.

If this crop of pease succeeds, it will immediately follow those on the hot-bed; but for fear this should miscarry, it will be proper to sow two more crops at

about a fortnight or three weeks distance from each other, so that there may be the more chances to succeed. This will be sufficient till the spring of the year, when you may sow several more crops of these pease at a fortnight distance from each other. The late sowings will be sufficient to continue the early sort of pease through the season, but it will be proper to have some of the large sort to succeed them for the use of the family; in order to which, you should sow some of the Spanish Morotto, which is a great bearer and a hardy sort of pea, about the middle of February, upon a clear open foot of ground. These must be sown in rows about four feet asunder, and the pease should be dropped in the drills about an inch distance, covering them about two inches deep with earth, being very careful that none of them lie uncovered, which will draw the mice, pigeons, or rooks, to attack the whole spot; and it often happens, by this neglect, that a whole plantation is devoured by these creatures; whereas, when there are none of the pease left in sight, they do not easily find them out.

About a fortnight after this you should sow another sort, either of this sort or any other large sort of pea, to succeed those; and then continue to repeat sowing once a fortnight, till the middle or latter end of May; only observing to allow the marrowfats, and other very large sorts of pease, at least four feet and a half between row and row; and the rose-pea should be allowed at least eight or ten inches distance plant from plant in the rows; for these grow very large, and if they have not room allowed them, they will spoil each other by drawing them up very tall, and will produce no fruit.

When the plants come up, the earth should be drawn up to their flanks (as was before directed), and the ground kept entirely clear from weeds; and when the plants are grown eight or ten inches high, you should stick some brushwood into the ground close to the pease for them to ramp upon, which will support them from trailing upon the ground, which is very apt to rot the growing sorts of pease, especially in wet seasons; besides, by thus supporting them, the air can freely pass between them, which will preserve the blossoms from falling off before their time, and occasion them to bear much better than if permitted to lie upon the ground, and there will be room to pass between the rows to gather the pease when they are ripe.

The dwarf sorts of pease may be sown much closer together than those before-mentioned; for these seldom rise above a foot high, and rarely spread above half a foot in width, so that these need not have more room than two feet row from row, and not above an inch asunder in the rows. These will produce a good quantity of pease, provided the season be not over-dry; but they seldom continue long in bearing, so that they are not so proper to sow for the main crop when a quantity of pease is expected for the table, their chief excellency being for hot-beds, where they will produce a greater quantity of pease (provided they are well managed) than if exposed to the open air, where the heat of the sun soon dries them up.

The large growing sorts may be cultivated for the common use of the family, because these will produce in greater quantities than the other, and will endure the drought better; but the early kind are by far the sweeter-tailed pease.

The best of all the large kinds is the marrowfat, which, if gathered young, is a well-tasted pea; and this will continue good through the month of August, if planted on a strong soil.

The gray and other large winter-pease are seldom cultivated in gardens, because they require a great deal of room, but are usually sown in fields. For the proper method of managing them, see AGRICULTURE, n<sup>o</sup> 124.

PITCAIRNE (Dr Archibald), a most eminent physician and ingenious poet, was descended from the ancient family of the Pitcairnes of Pitcairne in Fifeshire, and was born at Edinburgh on the 25th of December 1652. He commenced his studies at the school of Dalkeith; and from thence he was removed to the university of Edinburgh, where he improved himself in classical learning, and completed a regular course of philosophy. His friends, according to the authors of the *Biographia Britannica*, were desirous that he should follow the profession of theology. The unpleasant gloom, however, which at that time hung over religion and its professors in Scotland, could not but very ill suit with that native cheerfulness of temper and liberality of mind which made him, long after, a mark for the arrows of preciseness and grimace. The law seems to have been his own choice, and to this science he turned his attention. With an ardour peculiar to himself, and an ambition to excel in whatever he undertook, he pursued it with so much intenseness, that his health began to be impaired. On this account, his physicians advised him to set out for the south of France. By the time he reached Paris, he was happily so far recovered, that he determined to renew his studies; but being informed that there was no able professor of law in that city, and finding several gentlemen of his acquaintance engaged in the study of physics, he went with them to the lectures and hospitals, and employed himself in this manner for several months, till his affairs called him home.

On his return, he applied himself chiefly to the mathematics. It is not usual to see the briars of this science and the flowers of poetry growing in the same soil. Here, however, they were happily united; and to this union perhaps was owing that singular command of judgment, over one of the liveliest of fancies, which appears in every part of his works. His intimacy with Dr David Gregory, the celebrated mathematical professor, began about the same time; and probably conduced to cherish his natural aptitude for this study. It was then, in a great measure, new to him; it soon became his principal delight; his progress in it was rapid, and correspondent to his progress in other pursuits. His improvements on the method of infinite series then adopted, which Dr Wallis of Oxford afterwards published, were a conspicuous and early proof of his abilities in this science.

Had Dr Pitcairne continued to prosecute the study of the law, and could he have moulded his principles to the times, the first offices and honours of the state might have been looked for without presumption as the probable reward of such talents as he possessed. Struck, however, with the charms of mathematical truth which had been lately introduced into the philosophy of medicine, and hoping to reduce the healing art to geometrical method, he unalterably determined

on this left aspiring profession. At the period when he formed this resolution, the ideas of the medical world, already sufficiently confused, were still farther jumbled by the discovery of the circulation of the blood, which had as yet produced nothing but doubt, uncertainty, and astonishment. In Edinburgh at that time there was no school, no hospital, no opportunity of improvement but the chamber and the shop. He therefore soon after returned to Paris. Genius and industry are unhappily not often united in the same character: of such an union Dr Pitcairne is a celebrated instance. During his residence in France, he cultivated the object of his pursuit with his natural enthusiasm, and with a steadiness from which he could not be diverted by the allurements of that joy, which, in his hours of social and festive intercourse, he always felt and always gave. Among his various occupations, the study of the ancient physicians seems to have had a principal share. This appears from a treatise which he published some time after his return; and it shows, that he wisely determined to know the progress of medicine from its earliest periods, before he attempted to reform and improve that science.

On the 13th of August 1680, he received, from the faculty of Rheims, the degree of Doctor; which, on the 7th of August 1699, was likewise conferred on him by the university of Aberdeen; both being attended with marks of peculiar distinction. Other medical honours are said to have been conferred on him in France and elsewhere; but nothing affords a more unequivocal testimony to his abilities than that which the surgeons of Edinburgh gave, in admitting him, freely and unsolicited, a member of their college. None had such opportunities of judging of his merit as a practitioner, and on no physician did they ever bestow the same public mark of respect. Soon after his graduation at Rheims, he returned to Edinburgh; where, on the 29th of November 1681, the Royal College of Physicians was instituted; and his name, among others, graced the original patent from the Crown.

In his *Solutio problematis de inventioribus*, the treatise above alluded to, he discovers a wonderful degree of medical literature, and makes use of it in a manner that does great honour both to his head and his heart. His object is to vindicate Dr Harvey's claim to the discovery of the circulation of the blood. The discovery was, at first, controverted by envy, and repudiated by ignorance. When at length its truth was fully established, many individually attempted to tear the laurels from the illustrious Englishman, and to plant them on the brows of Hippocrates and others. Had the attempt been directed against himself, the generous soul of Pitcairne could not have exerted more zeal in a defence; and his arguments remain unanswered.

During his residence in Scotland, his reputation became so considerable, that, in the year 1691, the university of Leyden solicited him to fill the medical

chair, at that time vacant. Such an honourable testimony of respect, from a foreign nation, and from such a university, cannot perhaps be produced in the medical biography of Great Britain. The lustre of such characters reflects honour on their profession, and on the country which has the good fortune of giving them birth; and serves to give the individuals of that country not only a useful estimation in their own eyes, but in those also of the rest of the world. Dr Pitcairne's well-known political principles excluded him from public honours and promotion at home: he therefore accepted the invitation from abroad; and, on the 26th of April 1692, delivered, at Leyden, his elegant and masterly inaugural oration: *Oratio qua ostenditur medicinam ab omni philosophorum secta esse liberam*. In this he clears medicine from the rubbish of the old philosophy; separates it from the influence of the different sects; places it on the broad and only sure foundation of experience; shows how little good inquiries into the manner how medicines operate have done to the art; and demonstrates the necessity of a sedulous attention to their effects, and to the various appearances of disease.

Nothing (says an elegant panegyrist \* of our author) \* Dr Ch. Webster, in the *Harveian Oration* at Edinburgh for the year 1781; from which performance the present article is chiefly extracted.

He discharged the duties of his office at Leyden so as to answer the most sanguine expectations. He taught with a perspicuity and eloquence which met with universal applause. Independently of the encomiums of Boerhaave and Mead, who were his pupils, the numerous manuscript copies of his lectures, and the mutilated specimen of them † which found its way † *Elementa Medicinæ* into the world without his knowledge, show how justly it was bestowed. At the same time, he was not more celebrated as a professor than as a practical physician; and notwithstanding the multiplicity of his business in both these characters, he found leisure to publish several treatises on the circulation and some other of the most important parts of the animal economy (A).

At the close of the session, he set out for Scotland, with an intention of returning in time for the succeeding one. On his marrying (B) the daughter of Sir Archibald Stevenson, the object of his journey, her relations would on no account consent to part with him again. He was therefore reluctantly obliged to remain; and he wrote the university a polite apology, which was received with the utmost regret. He even declined the most flattering solicitations and tempting offers to settle in London. Indeed he soon came into that extensive practice to which his abilities en-  
34 X 2 titled

(A) Dr Boerhaave gives the following character of these and some other of Dr Pitcairne's dissertations, which were collected and published at Rotterdam, anno 1701: "Hæc scripta optima sunt et perfecta, five legas Dissertationem de Motu Sanguinis per Pulmones, five alia opuscula, five ultimum tractatum de Opio." *Methodus studii, ab Hallero edita*, p. 569.

(B) He had been married before to a daughter of Colonel James Hay of Pitfour, by whom he had a son and daughter, who both died young.

Pitcairne, titled him, and was also appointed titular professor of medicine in the university of Edinburgh.

The uniformity of a professional life is seldom interrupted by incidents worthy of record. Specimens, however, of that brilliant wit with which he delighted his friends in the hours of his leisure, continue to entertain us (c); and the effects of that eminent skill which he exerted in the cure of disease, still operate to the good of posterity.

The discovery of the circulation, while in some measure it exploded the chemical and Galenical doctrines, tended to introduce mathematical and mechanical reasoning in their stead. Of this theory (d) Dr Pitcairne was the principal support, and the first who introduced it into Britain. A mathematical turn of mind, and a wish for mathematical certainty in medicine, biased him in its favour, and he pushed it to its utmost extent. One is at a loss whether most to admire or regret such a waste of talents in propping a theory, which, though subversive of former ones, was to fall before others, but a little more satisfactory than itself. Mechanical physicians expected more from geometry than that science could grant. They made it the foundation instead of an auxiliary to their inquiries, and applied it to parts of nature not admitting mathematical calculations. By paying more attention afterwards to the supreme influence of the living principle, the source of all the motions and functions of the body, it was found that these could not be explained by any laws of chemistry or mechanism. They are still, however, involved in

obscurity; and, notwithstanding the numberless improvements which have taken place in the sciences connected with medicine, will perhaps remain inscrutable while man continues in his present stage of existence.

In a science so slowly progressive as that of medicine, Dr Pitcairne did a great deal. By labouring in vain for truth in one road, he saved many the same drudgery, and thereby shewed the necessity of another. He not only exploded many false notions of the chemists and Galenists, which prevailed in his time, but many of those too of his own sect. In particular, he shewed the absurdity of referring all diseases and their cures to an alkali or an acid (e). He refuted the idea of secretion being performed by pores differently shaped (f), Bellini's opinion of effluences in the animal-spirits with the blood, and Borelli's of air entering the blood by respiration (g). He proved the continuity of the arteries and veins (h); and seems to have been the first who shewed that the blood flows from a smaller capacity into a larger, that the aorta, with respect to the arterial system, is the apex of a cone (i). In this therefore he may be considered as the latent spring of the discoveries respecting the powers moving the blood. He introduced a simplicity of prescription, unknown in pharmacy before his time (k); and such was the state of medicine in this country, that scarcely have the works of any contemporary or preceding author been thought worthy even of preservation (l). As to the errors of his philosophy, let it be remembered, that no theory has as yet stood the test

(c) Vide *Pitcairni Poemata*.—Several of his poems, however, are obscure, and some of them totally unintelligible without a key. In those of them which are of a political kind, he wished not to express himself too clearly; and in others, he alludes to private occurrences which were not known beyond the circle of his companions. His poem (*ad Lindesum*), addressed to his friend Lindsey, is commented on by the authors of the *Biographia Britannica*; and it is to be regretted that it is the only one on which they have been solicitous to throw light. "Some parts (say they) of this poem are hardly intelligible, without knowing a circumstance in the Doctor's life, which he often told, and never without some commotion. It is a well-known story of the two Platonic philosophers, who promised one another, that which ever died first should make a visit to his surviving companion. This story being read together by Mr Lindsey and our author, they, being both then very young, entered into the same engagement. Soon after, Pitcairne, at his father's house in Fife, dreamed one morning, that Lindsey, who was then at Paris, came to him, and told him he was not dead, as was commonly reported, but still alive, and lived in a very agreeable place, to which he could not yet carry him. By the course of the poet, news came of Lindsey's death, which happened very suddenly the morning of the dream. When this is known, the poem is easily understood, and shines with no common degree of beauty.

"Lyndesi! Stygias jam dudum veste per undas,

"Stagnaue Cocytii non adeunda mihi;

"Excute paulisper Lethæi vincula fœni;

"Ut feriant animum carmina nostra tuum.

"Te nobis, te redde tuis, promissa daturus

"Gaudia; sed proavo sis comitante redux;

"Namque novos viros mutataque regna videbis,

"Passaque Teutonicas sceptrâ Britannia manus \*.

[\* Written in 1689.]

"He then proceeds to exclaim against the principles and practices which produced this Teutonic violence upon the British sceptre; and concludes with a wish, that Lindsey might bring Radamantus with him to punish them.

"Unus abest scelus vindex Radamanthus; amice,

"Dil faciant reditus fit comes ille tui!

"Every one sees how much keener an edge is given to the satire upon the Revolution, by making it an additional reason for his friend's keeping his promise to return him a visit after his death."

Pitching.

test of many years in an enlightened period. His own hung very loosely about him (m), and the present generally received practice differs from his very little in reality. He treated inflammatory and hæmorrhagic diseases by bleeding, purging, and blistering, as has been done uniformly and solely on the different theories since. His method of administering mercury and the bark is observed at this day; and with respect to febrile, nervous, glandular, and dropical affections, they seem to be as often the opprobriums of the art now, as they were then.

Dr Pitcairne was universally considered as the first physician of his time. No one appears ever to have had so much practice in this country, or so many consultations from abroad; and no one, from all accounts, ever practised with greater sagacity and success. The highest thought themselves honoured by his acquaintance, and the lowest were never denied his assistance and advice. The emoluments of his profession must have been great; but his charities are known to have been correspondent. The possession of money he postponed to more liberal objects: he collected one of the finest private libraries in the world; which was purchased, after his death, by the Czar of Muscovy. Notwithstanding the fatigues he underwent in the exercise of his profession, his constitution was naturally delicate. About the beginning of October 1713, he became affected with his last illness; and on the 23d he died, regretted by science as its ornament, by his country as its boast, and by humanity as its friend. He left a son and four daughters; of whom only one of the latter now survives. The present noble family of Kelly are his grandchildren.

Some anonymous publications are attributed to Dr Pitcairne, particularly a treatise *De Legibus Historiæ Naturalis*, &c.; but the only ones he thought proper to legitimate are his *Dissertationes Medice*, and a short essay *De Salute*.

PITCH, a tenacious oily substance, drawn chiefly from pines and firs, and used in shipping, medicine, and various arts: or it is more properly tar inspissated by boiling it over a slow fire. See TAR.

PITCHING, in sea-affairs, may be defined, the vertical vibration which the length of a ship makes about her centre of gravity; or the movement by which she plunges her head and after part alternately into the hollow of the sea. This motion may proceed from two causes: the waves, which agitate the vessel; and the wind upon the sails, which makes her lurch to every blast thereof. The first absolutely depends upon the agitation of the sea, and is not susceptible of inquiry; and the second is occasioned by the inclination of the masts, and may be submitted to certain established maxims.

When the wind acts upon the sails, the mast yields to its effort, with an inclination, which increases in proportion to the length of the mast, to the augmentation of the wind, and to the comparative weight and distribution of the ship's lading.

The repulsion of the water, to the effort of gravity, opposes itself to this inclination, or at least sustains it, by as much as the repulsion exceeds the momentum,

or absolute effort of the mast, upon which the wind operates. At the end of each blast, when the wind suspends its action, this repulsion lifts the vessel; and these successive inclinations and repulsions produce the movement of pitching, which is very inconvenient; and, when it is considerable, will greatly retard the course, as well as endanger the mast, and strain the vessel.

PITISCUS (Samuel), a learned antiquary, born at Zutphen, was rector of the college of that city, and afterwards of St Jerome at Utrecht, where he died on the 1st of February 1717, aged ninety. He wrote, 1. *Lexicon Antiquitatum Romanorum*, in two volumes folio; a work which is esteemed. 2. Editions of many Latin authors, with notes; and other works.

PITS (John), the biographer, was born in 1560, at Aulton in Hampshire; and educated at Wykeham's school, near Winchester, till he was about 18 years of age; when he was sent to New-college in Oxford, and admitted probationer fellow. Having continued in that university not quite two years, he left the kingdom as a voluntary Romish exile, and retired to Doway; thence he went to the English college at Rheims, where he remained about a year; and then proceeded to Rome, where he continued a member of the English college near seven years, and was made a priest. In 1589 he returned to Rheims; and there, during two years, taught rhetoric and the Greek language. He now quitted Rheims, on account of the civil war in France; and retired to Pont à Mousson in Loraine, where he took the degrees of master of arts and bachelor in divinity. Hence he travelled into Germany; and resided a year and a half at Triers, where he commenced licentiate in his faculty. From Triers he visited several of the principal cities in Germany; and continuing three years at Ingolstadt in Bavaria, took the degree of doctor in divinity. Thence having made the tour of Italy, he returned once more to Loraine; where he was patronised by the cardinal of that duchy, who preferred him to a canonry of Verdun; and about two years after, he became confessor to the duchess of Cleves, daughter to the duke of Loraine. During the leisure he enjoyed in this employment, he wrote in Latin the lives of the kings, bishops, apostolical men, and writers of England. The last of these, commonly known and quoted by this title, *De illustribus Angliæ scriptoribus*, was published after his death. The three first remain still in manuscript, among the archives of the collegiate church of Liverdun. The duke of Cleves dying, after Pits had been about twelve years confessor to the duchess, he returned to Loraine, attended by our author, who was promoted to the deanery of Liverdun, which, with a canonry and officialship, he enjoyed to the end of his life. He died in 1616, and was buried in the collegiate church. Pits was undoubtedly a scholar, and not an inelegant writer; but he is justly accused of ingratitude to Bale, from whom he borrowed his materials, without acknowledgment. He quotes Le-

land

(m) Patet, *says he*, medicinam esse memoriam eorum quæ cuilibet morbo usus ostendit fuisse utilis. Nam notas non esse corporum intra venas fluentium aut consensuum naturas, adeoque sola observatione innoscere quid cuique morbo conveniat, postquam sepius eadem eadem morbo profuisse comperimus. *De Div. Morb.*

land with great familiarity, without ever having seen his book : his errors are innumerable, and his partiality to the Romish writers most obvious ; nevertheless we are obliged to him for his account of several popish authors, who lived abroad at the beginning of the Reformation.

PITT (Christopher), an eminent English poet, celebrated for his excellent translation of Virgil's *Æneid*, was born in the year 1699. Having studied four years at New-college, Oxford, he was presented to the living of Pimperne in Dorsetshire, which he held during the remainder of his life. He had for poetical a turn, that while he was a school-boy he wrote two large folios of manuscript poems, one of which contained an entire translation of Lucan. He was much esteemed while at the university ; particularly by the celebrated Dr Young, who used familiarly to call him his *son*. Next to his fine translation of Virgil, Mr Pitt gained the greatest reputation by his excellent English translation of Vida's art of poetry. This amiable poet died in the year 1648, without leaving, it is said, one enemy behind him.

PITT (William) earl of Chatham, a most celebrated British statesman and patriot, was born in November 1708. He was the youngest son of Robert Pitt, Esq; of Boconnock in Cornwall ; and grandson of Thomas Pitt, Esq; governor of Fort St George in the East Indies, in the reign of queen Anne, who sold an extraordinary fine diamond to the king of France for 135,000*l*. and thus obtained the name of *Diamond Pitt*. His intellectual faculties and powers of elocution very soon made a distinguished appearance ; but, at the age of 16, he felt the attacks of an hereditary and incurable gout, by which he was tormented at times during the rest of his life.

His lordship entered early into the army, and served in a regiment of dragoons. Through the interest of the duchess of Marlborough, he obtained a seat in parliament before he was 21 years of age. His first appearance in the house was as representative of the borough of Old Sarum, in the ninth parliament of Great Britain. In the 10th he represented Seaford, Aldborough in the 11th, and the city of Bath in the 12th ; where he continued till he was called up to the house of peers in 1766. The intention of the duchess in bringing him thus early into parliament was to oppose Sir Robert Walpole, and whom he kept in awe by the force of his eloquence. At her death the duchess left him 10,000*l*. on condition, as was then reported, that he should never receive a place in administration. However, if any such condition was made, it certainly was not kept on his Lordship's part. In 1746 he was appointed vice-treasurer of Ireland, and soon after paymaster general of the forces, and sworn a privy-counsellor. He discharged the office of paymaster with such honour and inflexible integrity, refusing even many of the perquisites of his office, that his bitterest enemies could lay nothing to his charge, and he soon became the darling of the people. In 1755 he resigned the office of paymaster, on seeing Mr Fox preferred to him. The people were alarmed at this resignation ; and being disgusted with the unsuccessful beginning of the war, complained so loudly, that, on the 4th December 1756, Mr Pitt was appointed secretary of state in the room of Mr Fox afterwards Lord

Holland ; and other promotions were made in order to second his plans. He then took such measures as were necessary for the honour and interest of the nation ; but in the month of February 1757, having refused to assent to the carrying on a war in Germany for the sake of his majesty's dominions on the continent, he was deprived of the seals on the 5th of April following. Upon this the complaints of the people again became so violent, that on the 29th of June he was again appointed secretary, and his friends to other important offices. The success with which the war was now conducted is universally known ; yet on the 5th of October 1761, Mr Pitt, to the astonishment of almost the whole kingdom, resigned the seals into his majesty's own hands. The reason of this was, that Mr Pitt, having received certain intelligence that the family compact was signed between France and Spain, and that the latter was about to join France against us, thought it necessary to prevent her by commencing hostilities first. Having communicated this opinion in the privy-council, the other ministers urged that they would think twice before they declared war against this kingdom. " I will not give them leave to think, (replied Mr Pitt) ; this is the time, let us crush the whole house of Bourbon. But if the members of this board are of a different opinion, this is the last time I shall ever mix in its councils. I was called into the ministry by the voice of the people, and to them I hold myself answerable for my conduct. I am to thank the ministers of the late king for their support ; I have served my country with success ; but I will not be responsible for the conduct of the war any longer than while I have the direction of it." To this bold declaration, the lord who then presided in council, made the following reply. " I find the gentleman is determined to leave us ; nor can I say that I am sorry for it, since he would otherwise have certainly compelled us to leave him. But if he is resolved to assume the right of advising his majesty, and directing the operations of the war, to what purpose are we called to this council ? When he talks of being responsible to the people, he talks the language of the house of commons, and forgets that at this board he is responsible only to the king. However, though he may possibly have convinced himself of his infallibility, still it remains that we should be equally convinced before we can resign our understandings to his direction, or join with him in the measure he proposes."

This conversation, which was followed by Mr Pitt's resignation, is sufficient to shew the haughtiness and imperious temper of our minister. However, these very qualities were sometimes productive of great and good consequences, as appears from the following anecdote. — Preparatory to one of the secret expeditions during the last war, the minister had given orders to the different presiding officers in the military, navy, and ordnance departments, to prepare a large body of forces, a certain number of ships, and a proportionable quantity of stores, &c. and to have them all ready against a certain day. To these orders he received an answer from each of the officers, declaring the total impossibility of a compliance with them. Notwithstanding it was then at a very late hour, he sent immediately for his secretary ; and after expressing his resentment at the ignorance or negligence of his majesty's servant,

Pitt.

vants, he gave the following commands:—"I desire, Mr Wood, that you will immediately go to Lord Anson; you need not trouble yourself to search the admiralty, he is not to be found there; you must pursue him to the gaming-house, and tell him from me, that if he does not obey the orders of government which he has received at my hands, that I will most assuredly impeach him. Proceed from him to Lord Ligonier; and though he should be bolstered with harlots, undraw his curtains, and repeat the same message. Then direct your course to Sir Charles Frederick, and assure him, that if his majesty's orders are not obeyed, they shall be the last which he shall receive from me."

In consequence of these commands, Mr Wood proceeded to White's, and told his errand to the first lord of the admiralty; who insisted that the secretary of state was out of his senses, and it was impossible to comply with his wishes: "however, (added he), as madmen must be answered, tell him that I will do my utmost to satisfy him." From thence he went to the commander in chief of the forces, and delivered the same message. He also said that it was an impossible business; "and the secretary knows it, (added the old lord): nevertheless, he is in the right to make us do what we can; and what is possible to do, inform him, shall be done." The surveyor-general of the ordnance was next informed of Mr Pitt's resolution; and, after some little consideration, he began to think that the orders might be completed within the time prescribed. The consequence, at last, was that every thing, in spite of impossibilities themselves, was ready at the time appointed.

After his resignation in 1761, Mr Pitt never had any share in administration. He received a pension of 3000 l. a-year, to be continued after his decease, during the furvivance of his lady and son; and this gratuity was dignified with the title of *Baroness of Chatham* to his lady, and that of *baron* to her heirs-male. Mr Pitt at that time declined a title of nobility; but in 1766 accepted of a peerage under the title of *Baron Pymfent and Earl of Chatham*, and at the same time he was appointed lord privy-seal.

This acceptance of a peerage proved very prejudicial to his lordship's character. However, he continued steadfast in his opposition to the measures of administration. His last appearance in the House of Lords was on the 2d of April 1778. He was then very ill and much debilitated: but the question was important; being a motion of the duke of Richmond to address his majesty to remove the ministers, and make peace with America on any terms. His lordship made a long speech, which had certainly overcome his spirits: for, attempting to rise a second time, he fell down in a convulsive fit; and though he recovered for that time, his disorder continued to increase till the 11th of May, when he died at his seat at Hayes. His death was lamented as a national loss. As soon as the news reached the house of commons, which was then sitting, Colonel Barré made a motion, that an address should be presented to his majesty, requesting that the Earl of Chatham should be buried at the public expence. But Mr Rigby having proposed the erecting of a statue to his memory, as more likely to perpetuate the sense of his great merits entertained by the public, this was unanimously carried. A bill was soon after

passed, by which 4000 l. a-year was settled upon John, now Earl of Chatham, and the heirs of the late Earl to whom that title may descend.—His lordship was married in 1754 to Lady Hester, sister to the earl of Temple; by whom he had three sons and two daughters.

**PITUITARY GLAND.** See *ANATOMY*, n° 397, c.

**PIVAT,** or **PIVOT**, a foot or shoe of iron or other metal, usually conical or terminating in a point, whereby a body, intended to turn round, bears on another fixed at rest, and performs its revolutions. The pivot usually bears or turns round in a sole, or piece of iron or brass, hollowed to receive it.

**PIZARRO** (Francis), a celebrated Spanish general, the discoverer and conqueror of Peru, in conjunction with Diego Almagro, a Spanish navigator. They are both charged with horrid cruelties to the inhabitants; and they fell victims to their own ambition, jealousy, and avarice. Almagro revolting, was defeated, and beheaded by Pizarro, who was assassinated by Almagro's friends, in 1541. See *PERU*.

**PLACE**, **LOCUS**, in philosophy, a mode of space, or that part of immoveable space which any body possesses. See *METAPHYSICS*, n° 50.

**PLACE** in astronomy. The place of the sun, a star, &c. denotes the sign and degree of the zodiac which the luminary is in; or the degree of the ecliptic, reckoning from the beginning of aries, which the planet or star's circle of longitude cuts; and therefore coincides with the longitude of the sun, planet, or star. As the sine of the sun's greatest declination  $23^{\circ} 30'$ : to the sine of any present declination given or observed, for instance,  $23^{\circ} 15'$ : so is the radius 10: to the sine of his longitude  $81^{\circ} 52'$ ; which, if the declination were north, would give  $20^{\circ} 52'$  of Gemini; if south,  $20^{\circ} 52'$  of capricorn, for the sun's place. See *DECLINATION*, &c.

The place of the moon being that part of her orbit wherein she is found at any time, is of various kinds, by reason of the great inequalities of the lunar motions, which render a number of equations and reductions necessary before the just point be found. The moon's fictitious place is her place once equated; her place nearly true, is her place twice equated; and her true place thrice equated. See *ASTRONOMY*, *passim*.

**PLACE**, in war, a general name for all kinds of fortresses where a party may defend themselves. Thus, 1. A strong or fortified place, is one flanked, and covered with bastions. 2. A regular place, one whose angles, sides, bastions, and other parts, are equal; and this is usually denominated from the number of its angles, as a pentagon, hexagon, &c. 3. Irregular place, is one whose sides and angles are unequal. 4. Place of arms, is a strong city or town pitched upon for the chief magazine of an army; or, in a city or garrison, it is a large open spot of ground, usually near the centre of the place where the grand guard is commonly kept, and the garrison holds its rendezvous at reviews, and in cases of alarm to receive orders from the governor. 5. Places of arms of an attack, in a siege, is a spacious place covered from the enemy by a parapet or epaulement, where the soldiers are posted ready to sustain those at work in the trenches against the soldiers of the garrison. 6. Place of arms particular, in a garrison, a place near every bastion, where

Pituitary  
Place.

Place  
||  
Plagiary.

where the soldiers sent from the grand place to the quarters assigned them relieve those that are either upon the guard or in fight. 7. Place of arms without, is a place allowed to the covert-way for the planting of cannon, to oblige those who advance in their approaches to retire. 8. Place of arms in a camp, a large place at the head of the camp for the army to be ranged in and drawn up in battalia. There is also a place for each particular body, troop, or company, to assemble in.

*Common-Place.* See *COMMON-Place*.

**PLACENTA**, in anatomy and midwifery, a soft roundish mass, found in the womb of pregnant women; which, from its resemblance to the liver, was called by the ancients *hepar uterinum*, uterine liver.

**PLACENTIA**, a town of Italy, and capital of a duchy of the same name, with a bishop's see. It is seated about 100 paces from the river Po, in a very fertile pleasant plain, watered by a great number of rivulets, and surrounded with hills, abounding in all sorts of fruits. In its territory there are salt-springs, from which they make a very white salt; and there are also mines of iron, woods, and warrens. It is very populous, and contains a great number of merchants. It is defended by a wall and a strong citadel, and is reckoned three miles in circumference. The houses are low, generally built of brick, and some of them are prettily painted. The cathedral is an ancient structure, but well adorned within. The number of the inhabitants is about 18,000, among whom there are 2000 ecclesiastics. This city has been taken several times in the wars of Italy. The king of Sardinia took possession of it in 1744, it being ceded to him by the queen of Hungary; but it was taken from him in 1746, after a bloody battle. It has a famous university, and the inhabitants are much esteemed for their politeness. There is a great fair here every year on the 15th of April, which is much frequented. Placentia is seated on the river Po, in E. Long. 9. 43. N. Lat. 45. 5.

**PLAGIARY**, in philology, the purloining another man's works, and putting them off as our own. Among the Romans, *plagiarius* was properly a person who bought, sold, or retained a freeman for a slave; and was so called, because, by the Flavian law, such persons were condemned *ad plagas*, "to be whipped."

Thomasius has an express treatise *De plagio literario*; wherein he lays down the laws and measures of the right which authors have to one another's writings.—"Dictionary-writers, at least such as meddle with *arts and sciences*, (as is pertinently observed by Mr Chambers), seem exempted from the common laws of *meum and tuum*; they do not pretend to set up on their own bottom, nor to treat you at their own cost. Their works are supposed, in great measure, compositions of other peoples'; and what they take from others, they do it avowedly, and in the open sun.—In effect, their quality gives them a title to every thing that may be for their purpose, wherever they find it; and if they rob, they do not do it any otherwise, than as the bee does, for the public service. Their occupation is not pillaging, but collecting contributions; and if you ask them their authority, they will produce you the

practice of their predecessors of all ages and nations." Plagium

**PLAGIUM**, in law. See *KIDNAPPING*.

**PLAGUE**, PESTILENCE, or *Pestilential Fever*. See *MEDICINE*, n° 325.

The commission at Moscow, having, in the year 1770, invented a fumigation-powder, which, from several lesser experiments, had proved efficacious in preventing the infection of the plague; in order more fully to ascertain its virtue in that respect, it was determined, towards the end of the year, that ten malefactors under sentence of death, should, without undergoing any other precautions than the fumigations, be confined three weeks in a lazarette, be laid upon the beds, and dressed in the cloaths, which had been used by persons sick, dying, and even dead, of the plague in the hospital. The experiment was accordingly tried, and none of the ten malefactors were then infected, or have been since ill. The fumigation-powder is prepared as follows.

*Powder of the first strength.*] Take leaves of juniper, juniper-berries pounded, ears of wheat, guaiacum-wood pounded, of each six pounds; common saltpetre pounded, eight pounds; sulphur pounded, six pounds; Smyrna tar, or myrrh, two pounds; mix all the above ingredients together, which will produce a pood of the powder of fumigation of the first strength. [*N.B.* A pood is 40 pounds Russian, which are equal to 35 pounds and a half or 36 pounds English averdupoise.]

*Powder of the second strength.*] Take southernwood cut into small pieces, four pounds; juniper-berries pounded, three pounds; common saltpetre pounded, four pounds; sulphur pounded, two pounds and a half; Smyrna tar, or myrrh, one pound and a half; mix the above together, which will produce half a pood of the powder of fumigation of the second strength.

*Odoriferous powder.*] Take the root called *kalmus* cut into small pieces, three pounds; leaves of juniper cut into small pieces, four pounds; frankincense pounded grossly, one pound; storax pounded, and rose-flowers, half a pound; yellow amber pounded, one pound; common saltpetre pounded, one pound and a half; sulphur, a quarter of a pound; mix all the above together, which will produce nine pounds and three quarters of the odoriferous powder.

*Remark on the powder of fumigation.*] If guaiacum cannot be had, the cones of pines or firs may be used in its stead; likewise the common tar of pines and firs may be used instead of the Smyrna tar or myrrh, and mugwort may supply the place of southernwood.

**PLAIN**, or **PLANE**, in general, an appellation given to whatever is smooth and even, or simple, obvious, and easy to be understood; and, consequently, stands opposed to rough, enriched, or laboured.

A plain figure, in geometry, is an uniform surface; from every point of whose perimeter right lines may be drawn to every other point in the same.

A plain angle is one contained under two lines, or surfaces, in contradistinction to a solid angle. See **ANGLE**.

The doctrine of plain triangles, as those included under three right lines, is termed *plain trigonometry*. See the article **TRIGONOMETRY**.

**PLAIN Chart.** See the article **CHART**.

**PLAIN-**

Plain  
Plane.

PLAIN-Sailing. See NAVIGATION, § 1.

PLAISE, the English name of a species of pleuronectes. See PLEURONECTES.

PLAN, in general, denotes the representation of something drawn on a plane: such are maps, charts, ichnographies, &c. See MAP, CHART, &c.

The term *plan*, however, is particularly used for a draught of a building, such as it appears, or is intended to appear, on the ground; shewing the extent, division, and distribution of its area, or ground-plot, into apartments, rooms, passages, &c.

A geometrical plan is that wherein the solid and vacant parts are represented in their natural proportions.

The raised plan of a building, is the same with what is otherwise called an *elevation*, or *orthography*. See ORTHOGRAPHY.

A perspective plan, is that exhibited by degradations, or diminutions, according to the rules of perspective. See PERSPECTIVE.

To render plans intelligible, it is usual to distinguish the masses, with a black wash; the projections on the ground are drawn in full lines, and those supposed over them in dotted lines. The augmentations, or alterations to be made, are distinguished by a colour different from what is already built; and the tints of each plan made lighter, as the stories are raised.

In large buildings, it is usual to have three several plans, for the three first stories.

PLANE, in geometry, denotes a plain surface, or one that lies evenly between its bounding lines: and as a right line is the shortest extension from one point to another, so a plane surface is the shortest extension from one line to another.

In astronomy, conics, &c. the term *plane* is frequently used for an imaginary surface, supposed to cut and pass through solid bodies; and on this foundation is the whole doctrine of conic sections built. See ASTRONOMY, CONIC SECTIONS, &c.

In mechanics, planes are either horizontal, that is, parallel to the horizon, or inclined thereto. See MECHANICS.

The determining how far any given plane deviates from an horizontal line, makes the whole business of levelling. See the article LEVELLING.

In optics, the planes of reflection and refraction, are those drawn through the incident and reflected or refracted rays. See OPTICS.

In perspective, we meet with the perspective plane, which is supposed to be pellucid, and perpendicular to the horizon; the horizontal plane, supposed to pass through the spectator's eye, parallel to the horizon; the geometrical plane, likewise parallel to the horizon, wherein the object to be represented is supposed to be placed, &c. See PERSPECTIVE.

The plane of projection in the stereographic projection of the sphere, is that on which the projection is made, corresponding to the perspective plane. See PROJECTION.

PLANE, in joinery, an edged tool or instrument for parting and shaving of wood smooth.—It consists of a piece of wood very smooth at bottom, as a stock or shaft; in the middle of which is an aperture, through which a steel edge, or chisel, placed obliquely, passes;

VOL. VIII.

1

which, being very sharp, takes off the inequalities of the wood along which it slides.

PLANE-Tree, in botany. See PLATANUS.

PLANET, a celestial body, revolving round the sun as a centre, and continually changing its position with respect to the fixed stars; whence the name *planet*, which is a Greek word, signifying “wanderer.”

The planets are usually distinguished into primary, and secondary. The primary ones, called by way of eminence *planets*, are those which revolve round the sun as a centre; and the secondary planets, more usually called *satellites*, or *moons*, are those which revolve round a primary planet as a centre, and constantly attend it in its revolution round the sun.

The primary planets, are again distinguished into superior and inferior. The superior planets, are those further from the sun than our earth; as Mars, Jupiter, and Saturn: and the inferior planets, are those nearer the sun than our earth, as Venus and Mercury. See ASTRONOMY.

That the planets are opaque bodies, like our earth, is thought probable, for the following reasons. 1. Since in Venus, Mercury, and Mars, only that part of the disk illuminated by the sun, is found to shine; and again, Venus and Mercury, when between the earth and the sun, appear like dark spots or macule on the sun's disk; it is evident, that Mars, Venus, and Mercury, are opaque bodies, illuminated with the borrowed light of the sun. And the same appears of Jupiter, from its being void of light in that part to which the shadow of the satellites reaches, as well as in that part turned from the sun; and that his satellites are opaque, and reflect the sun's light, is abundantly shown. Wherefore, since Saturn, with his ring and satellites, only yield a faint light, fainter considerably than that of the fixed stars, tho' these be vastly more remote; and than that of the rest of the planets; it is past doubt, that he too, with his attendants, are opaque bodies. 2. Since the sun's light is not transmitted through Mercury and Venus, when placed against him, it is plain they are dense opaque bodies; which is likewise evident of Jupiter, from his hiding the satellites in his shadow; and therefore, by analogy, the same may be concluded of Saturn. 3. From the variable spots of Venus, Mars, and Jupiter, it is evident these planets have a changeable atmosphere; which changeable atmosphere may, by a like argument, be inferred of the satellites of Jupiter; and therefore, by similitude, the same may be concluded of the other planets. 4. In like manner, from the mountains observed in Venus, the same may be supposed in the other planets. 5. Since then, Saturn, Jupiter, both their satellites, Mars, Venus, and Mercury, are opaque bodies, shining with the sun's borrowed light, are furnished with mountains, and encompassed with a changeable atmosphere; they have, of consequence, waters, seas, &c. as well as dry land, and are bodies like the moon, and therefore like the earth. Q. E. D. And hence, it seems also highly probable, that the other planets have their animal inhabitants, as well as our earth.

PLANETARIUM, an astronomical machine, so called from its representing the motions, orbits, &c.

Plane  
Planetarium.

Planetary  
||  
Plant.

Plant.

of the planets, agreeable to the Copernican system. See *ASTRONOMY*, n<sup>o</sup> 317. and Plate LI.

**PLANETARY**, something that relates to the planets. Hence we say, planetary worlds, planetary inhabitants, &c. Huygens and Fontenelle bring several probable arguments for the reality of planetary animals, plants, men, &c. See *PLANET*.

**PLANETARY System**, is the system or assemblage of the planets, primary and secondary, moving in their respective orbits, round their common centre the sun. See *ASTRONOMY*.

**PLANETARY Days**.—Among the ancients, the week was shared among the seven planets, each planet having its day. This we learn from Dion Cassius and Plutarch, *Synops.* l. 4. q. 7. Herodotus adds, that it was the Egyptians who first discovered what god, that is, what planet, presides over each day; for that among these people the planets were deities. And hence it is, that in most European languages, the days of the week are still denominated from the planets; Sunday, Monday, &c. See *WEEK*.

**PLANETARY Years**, the periods of time where the several planets make their revolutions round the sun, or earth.—As from the proper revolution of the sun, the solar year takes its original; so from the proper revolutions of the rest of the planets about the earth, so many sorts of years do arise, viz. the Saturnian year, which is defined by 29 Egyptian years, 174 hours, 58 minutes, equivalent in a round number to 30 solar years.—The Jovial year, containing 317 days, 14 hours, 59 minutes.—The Martial year, containing 321 days, 23 hours, 31 minutes.—For Venus and Mercury, as their years, when judged of with regard to the earth, are almost equal to the solar year; they are more usually estimated from the sun, the true centre of their motions: in which case, the former is equal to 224 days, 16 hours, 40 minutes; the latter to 87 days, 23 hours, 14 minutes.

**PLANIMETRY**, that part of geometry which considers lines and plain figures, without considering their height or depth. See *GEOMETRY*.

**PLANISPHERE**, signifies a projection of the sphere, and its various circles on a plane; in which sense, maps, whereon are exhibited the meridians, and other circles of the sphere, are planispheres. See *MAR.*

**PLANT**, is defined to be an organic body, destitute of sense and spontaneous motion, adhering to another body in such a manner as to draw from it its nourishment, and having a power of propagating itself by seeds.

The vegetation and economy of plants is one of those subjects in which our knowledge is extremely circumscribed. A total inattention to the structure and economy of plants is the chief reason of the small progress that has been made in the principles of vegetation, and of the instability and fluctuation of our theories concerning it; for which reason we shall give a short description of the structure of plants, beginning with the seed, and tracing its progress and evolution to a state of maturity.

[*Of Seeds.*] The seeds of plants are of various figures and sizes. Most of them are divided into two lobes; though some, as those of the cereals-kind, have six; and others, as the grains of corn, are not divided, but entire.

But, as the essential properties of all seeds are the same, when considered with regard to the principles of vegetation, our particular descriptions shall be limited to one feed, viz. the great garden-bean. Neither is the choice of this feed altogether arbitrary; for, after it begins to vegetate, its parts are more conspicuous than many others, and consequently better calculated for investigation.

This feed is covered with two coats or membranes. The outer coat is extremely thin, and full of pores; but may be easily separated from the inner one (which is much thicker), after the bean has been boiled, or lain a few days in the soil. At the thick end of the bean, there is a small hole visible to the naked eye, immediately over the radicle or future root, that it may have a free passage into the soil; fig. 1. A. When these coats are taken off, the body of the feed appears, which is divided into two smooth portions or lobes. The smoothness of the lobes is owing to a thin film or cuticle with which they are covered.

At the basis of the bean is placed the radicle or future root, fig. 3. A. The trunk of the radicle, just as it enters into the body of the feed, divides into two capital branches, one of which is inserted into each lobe, and sends off smaller ones in all directions thro' the whole substance of the lobes; fig. 7. AA. These ramifications become so extremely minute towards the edges of the lobes, that they require the finest glasses to render them visible. To these ramifications Grew and Malpighius have given the name of *feminal root*; because, by means of it, the radicle and plume, before they are expanded, derive their principal nourishment.

The plume, bud, or germ, fig. 3. is inclosed in two small corresponding cavities in each lobe. Its colour and consistence is much the same with those of the radicle, of which it is only a continuation; but having a quite contrary direction: for the radicle descends into the earth, and divides into a great number of smaller branches or filaments; but the plume ascends into the open air, and unfolds itself into all the beautiful variety of stem, branches, leaves, flowers, fruit, &c. The plume in corn shoots from the smaller end of the grain, and, among maltsters, goes by the name of *acrosipire*.

The next thing to be taken notice of is the substance, or parenchymatous part, of the lobes. This is not a mere concreted juice, but is curiously organized, and consists of a vast number of small bladders resembling those in the pith of trees; fig. 4.

Besides the coats, cuticle, and parenchymatous parts, there is a substance perfectly distinct from these, distributed in different proportions through the radicle, plume, and lobes. This inner substance appears very plainly in a transverse section of the radicle or plume. Towards the extremity of the radicle, it is one entire trunk; but higher up, it divides into three branches; the middle one runs directly up to the plume, and the other two pass into the lobes on each side, and spread out into a great variety of small branches through the whole body of the lobes, fig. 7. This substance is very properly termed the *feminal root*: for when the feed is sown, the moisture is first absorbed by the outer coats, which are every where furnished with sap and air-vessels; from these it is conveyed to the cuticle; from the

Plate  
CCXXXIX

cuticle it proceeds to the pulpy part of the lobes; when it has got thus far, it is taken up by the mouths of the small branches of the terminal root, and passes from one branch into another, till it is all collected into the main trunk, which communicates both with the plume and radicle, the two principal involved organs of the future plant. After this the sap, or vegetable food, runs in two opposite directions: part of it ascends into the plume, and promotes the growth and expansion of that organ; and part of it descends into the radicle, for nourishing and evolving the root and its various filaments. Thus the plume and radicle continue their progress in opposite directions, till the plant arrives at maturity.

It is here worth remarking, that every plant is really possessed of two roots, both of which are contained in the seed. The plume and radicle, when the seed is first deposited in the earth, derive their nourishment from the seminal root: but, afterwards, when the radicle begins to shoot out its filaments, and to absorb some moisture, not, however, in a sufficient quantity to supply the exigencies of the plume, the two lobes, or main body of the seed, rise along with the plume, assume the appearance of two leaves, resembling the lobes of the seed in size and shape, but having no resemblance to those of the plume, for which reason they have got the name of *diffimilar leaves*.

These dissimilar leaves defend the young plume from the injuries of the weather; and at the same time, by absorbing dew, air, &c. assist the tender radicle in nourishing the plume, with which they have still a connection by means of the seminal root above described. But, when the radicle or second root has descended deep enough into the earth, and has acquired a sufficient number of filaments or branches for absorbing as much aliment as is proper for the growth of the plume; then the seminal or dissimilar leaves, their utility being entirely superseded, begin to decay and fall off.

Plate  
CCXXXIX Fig. 1. A, the foramen or hole in the bean through which the radicle shoots into the soil.

Fig. 2. A transverse section of the bean; the dots being the branches of the seminal root.

Fig. 3. A, the radicle. B, the plume or bud.

Fig. 7. A view of the seminal root branched out upon the lobes.

Fig. 8. The appearance of the radicle, plume, and seminal root, when a little further advanced in growth.

Having thus briefly described the seed, and traced its evolution into three principal organic parts, *viz.* the plume, radicle, and seminal leaves, we shall next take an anatomical view of the root, trunk, leaves, &c.

2. *Of the Root.* In examining the root of plants, the first thing that presents itself is the skin, which is of various colours in different plants. Every root, after it has arrived at a certain age, has a double skin. The first is coeval with the other parts, and exists in the seed: but afterwards there is a ring sent off from the bark, and forms a second skin; *e. g.* in the root of the

dandelion, towards the end of May, the original or outer skin appears thrived, and is easily separated from the new one, which is fresher, and adheres more firmly to the bark. Perennial plants are supplied in this manner with a new skin every year; the outer one always falls off in the autumn and winter, and a new one is formed from the bark in the succeeding spring. The skin has numerous cells or vessels, and is a continuation of the parenchymatous part of the radicle. However, it does not consist solely of parenchyma; for the microscope shews that there are many tubular ligneous vessels interperfed through it.

When the skin is removed, the true cortical substance or bark appears, which is also a continuation of the parenchymatous part of the radicle, but greatly augmented. The bark is of very different sizes. In moist trees, it is exceeding thin in proportion to the wood and pith. On the other hand, in carrots, it is almost one half of the semidiameter of the root; and, in dandelion, it is nearly twice as thick as the woody part.

The BARK is composed of two substances; the parenchyma, or pulp, which is the principal part; and a few woody fibres. The parenchyma is exceedingly porous, and has a great resemblance to a sponge; for it shrivels considerably when dried, and dilates to its former dimensions when infused in water. These pores or vessels are not pervious so as to communicate with each other; but consist of distinct little cells or bladders, scarcely visible without the assistance of the microscope. In all roots, these cells are constantly filled with a thin watery liquor. They are generally of a spherical figure; though in some roots, as the bugloss and dandelion, they are oblong. In many roots, as the horse-radish, peony, asparagus, potatoe, &c. the parenchyma is of one uniform structure. But in others it is more diversified, and puts on the shape of rays running from the centre towards the circumference of the bark. These rays sometimes run quite through the bark, as in lovage; and sometimes advance towards the middle of it, as in melilot and most of the leguminous and umbelliferous plants. These rays generally stand at an equal distance from each other in the same plant; but the distance varies greatly in different plants. Neither are they of equal sizes: in carrot they are exceedingly small, and scarcely discernible; in melilot and chervil, they are thicker. They are likewise more numerous in some plants than in others. Sometimes they are of the same thickness from one edge of the bark to the other; and some grow wider as they approach towards the skin. The vessels with which these rays are amply furnished, are supposed to be air-vessels, because they are always found to be dry, and not so transparent as the vessels which evidently contain the sap.

In all roots, there are ligneous vessels dispersed in different proportions through the parenchyma of the bark. These ligneous vessels run longitudinally through the bark in the form of small threads, which are tubular, as is evident from the rising of the sap in them when a root is cut transversely. These ligneous sap-vessels do not run in direct lines through the bark, but, at small distances, incline towards one another in such a manner, that they appear to the naked eye to be insulated; but the microscope discovers them to be

only contiguous, and braced together by the parenchyma. These braces or coartulations are very various both in size and number in different roots; but in all plants they are most numerous towards the inner edge of the bark. Neither are these vessels single tubes; but, like the nerves in animals, are bundles of 20 or 30 small contiguous cylindrical tubes, which uniformly run from the extremity of the root, without fending off any branches, or suffering any change in their size or shape.

In some roots, as parsnip, especially in the ring next the inner extremity of the bark, these vessels contain a kind of lymph, which is sweeter than the sap contained in the bladders of the parenchyma. From this circumstance they have got the name of *lymph-ducts*.

These lymph-ducts sometimes yield a mucilaginous lymph, as in the comfrey; and sometimes a white milky glutinous lymph, as in the angelica, fenchus, burdock, scorzonera, dandelion, &c. The lymph-ducts are supposed to be the vessels from which the gums and ballams are secreted. The lymph of fennel, when exposed to the air, turns into a clear transparent balsam; and that of the scorzonera, dandelion, &c. condenses into a gum.

The situation of the vessels is various. In some plants, they stand in a ring or circle at the inner edge of the bark, as in asparagus; in others, they appear in lines, or rays, as in borage; in the parsnip, and several other plants, they are most conspicuous toward the outer edge of the bark; and in the dandelion, they are disposed in the form of concentric circles.

The Wood of roots is that part which appears after the bark is taken off, and is firmer and less porous than the bark or pith. It consists of two distinct substances, *viz.* the pulpy or parenchymatous, and the ligneous. The wood is connected to the bark by large portions of the bark inserted into it. These insertions are mostly in the form of rays, tending to the centre of the pith, which are easily discernible by the eye in a transverse section of most roots. These insertions, like the bark, consist of many vessels, mostly of a round or oval figure.

The ligneous vessels are generally disposed in collateral rows running longitudinally through the root. Some of these contain air, and others sap. The *air-vessels* are so called, because they contain no liquor. These air-vessels are distinguished by being whiter than the others.

The PITH is the central part of the root. Some roots have no pith, as the stramonium, nicotiana, &c.; others have little or none at the extremities of the roots, but have a considerable quantity of it near the top. The pith, like every other part of a plant, is derived from the feed: but in some it is more immediately derived from the bark. For the insertions of the bark running in betwixt the rays of the wood, meet in the centre, and constitute the pith. It is owing to this circumstance, that, among roots which have no pith in their lower parts, they are amply provided with it towards the top, as in columbine, lovage, &c.

The bladders of the pith are of very different sizes, and generally of a circular figure. Their position is more uniform than in the bark. Their sides are not mere films, but a composition of small fibres or threads;

which gives the pith, when viewed with a microscope, the appearance of a piece of fine gauze or net-work.

We shall conclude the description of roots, with observing, that their whole substance is nothing but a congeries of tubes and fibres, adapted by nature for the absorption of nourishment, and of course the extension and augmentation of their parts.

EEEE, the rays of the wood, in which the holes are the air-vessels. N. B. This root has no pith.

3. *Of the Trunk, Stalk, or Stem.*] In describing the trunks of plants, it is necessary to premise, that whatever is said with regard to them, applies equally to the branches.

The trunk, like the root, consists of three parts, *viz.* the bark, wood, and pith. These parts, though substantially the same in the trunk as in the root, are in many cases very different in their texture and appearance.

The skin of the BARK is composed of very minute bladders, interspersed with longitudinal woody fibres, as in the nettle, thistle, and most herbs. The outside of the skin is visibly porous in some plants, particularly the cane.

The principal body of the bark is composed of pulp or parenchyma, and innumerable vessels much larger than those of the skin. The texture of the pulpy part, though the same substance with the parenchyma in roots, yet seldom appears in the form of rays running towards the pith; and when these rays do appear, they do not extend above half way to the circumference. The vessels of the bark are very differently situated, and destined for various purposes in different plants. For example, in the bark of the pine, the inmost are lymph-ducts, and exceedingly small; the outmost are gum or resiniferous vessels, destined for the secretion of turpentine; and are so large, as to be distinctly visible to the naked eye.

The WOOD lies between the bark and pith, and consists of two parts, *viz.* a parenchymatous, and ligneous. In all trees, the parenchymatous part of the wood, though much diversified as to size and consistence, is uniformly disposed in diametrical rays, or insertions running betwixt similar rays of the ligneous part.

The true wood is nothing but a congeries of old dried lymph-ducts. Between the bark and the wood a new ring of these ducts is formed every year, which gradually loses its softness as the cold season approaches, and, towards the middle of winter, is condensed into a solid ring of wood. These annual rings, which are distinctly visible in most trees when cut thro', serve as natural marks to distinguish their age, (fig. 1. 2.) The rings of one year are sometimes larger, sometimes less, than those of another, probably owing to the favourableness or unfavourableness of the season.

The PITH, though of a different texture, is exactly of the same substance with the parenchyma of the

*Fig. 1. GARDEN BEAN*

Plant. the bark, and the insertions of the wood. The quantity of pith is various in different plants. Instead of being increased every year like the wood, it is annually diminished, its vessels drying up, and assuming the appearance and structure of wood; inasmuch, that in old trees there is scarce such a thing as pith to be discerned.

A ring of sap-vessels are usually placed at the outer edge of the pith, next the wood. In the pine, fig, and walnut, they are very large. The parenchyma of the pith is composed of small cells or bladders, of the same kind with those of the bark, only of a larger size. The general figure of these bladders is circular; though in some plants, as the thistle and borage, they are angular. Though the pith is originally one connected chain of bladders; yet as the plant grows old, they shrivel, and open in different directions. In the walnut, after a certain age, it appears in the form of a regular transverse hollow division. In some plants, it is altogether wanting; in others, as the sonchus, nettle, &c. there is only a transverse partition of it at every joint. Many other varieties might be mentioned; but these must be left to the observation of the reader.

KK, The great air-vessels. LL, the lesser ones. MMM, the parenchymatous insertions of the bark represented by the white rays. NO, the pith, with its bladders or cells.

4. *Of the Leaves.*] The leaves of plants consist of the same substance with that of the trunk. They are full of nerves, or woody portions, running in all directions, and branching out into innumerable small threads, interwoven with the parenchyma like fine lace or gauze.

The skin of the leaf, like that of an animal, is full of pores, which both serve for perspiration, and for the absorption of dews, air, &c. These pores, or orifices, differ both in shape and magnitude in different plants, which is the cause of that variety of texture or grain peculiar to every plant.

The pulpy or parenchymatous part consists of very minute fibres, wound up into small cells or bladders. These cells are of various sizes in the same leaf.

All leaves, of whatever figure, have a marginal fibre, by which all the rest are bounded. The particular shape of this fibre determines the figure of the leaf.

The vessels of leaves have the appearance of insculpting; but, when examined by the microscope, they are found only to be interwoven, or laid along each other.

What are called *air-vessels*, or those which carry no sap, are visible even to the naked eye in some leaves. When a leaf is slowly broke, they appear like small woolly fibres, connected to both ends of the bro-

ken piece.

Fig. 1. The appearance of the air-vessels to the eye, in a vine-leaf drawn gently asunder.

Fig. 2. A small piece cut off that leaf.

Fig. 3. The same piece magnified, in which the vessels have the appearance of a crew.

Fig. 4. The appearance of these vessels as they exist in the leaf before they are stretched out.

5. *Of the Flower.*] It is needless here to mention any thing of the texture, or of the vessels, &c. of flowers, as they are pretty similar to those of the leaf. It would be foreign to our present purpose, to take any notice of the characters and distinctions of flowers. These belong to the science of BOTANY, to which the reader is referred.

There is one curious fact, however, which must not be omitted, viz. That every flower is perfectly formed in its parts many months before it appears outwardly; that is, the flowers which appear this year, are not, properly speaking, the flowers of this year, but of the last. For example, mezeoreon generally flowers in January; but these flowers were completely formed in the month of August preceeding. Of this fact any one may satisfy himself by separating the coats of a tulip-root about the beginning of September; and he will find that the two innermost form a kind of cell, in the centre of which stands the young flower, which is not to make its appearance till the following April or May. Fig. 5. exhibits a view of the tulip-root when dissected in September, with the young flower towards the bottom.

6. *Of the Fruit.*] In describing the structure of fruits, a few examples shall be taken from such as are most generally known.

A pear, besides the skin, which is a production of the skin of the bark, consists of a double parenchyma, or pulp, sap, and air-vessels, calcareous, and acetary.

The outer parenchyma is the same substance continued from the bark, only its bladders are larger and more succulent.

It is every where interspersed with small globules or grains, and the bladders respect these grains as a kind of centres, every grain being the centre of a number of bladders. The sap and air-vessels in this pulp are extremely small.

Next the core is the inner pulp or parenchyma, which consists of bladders of the same kind with the outer, only larger and more oblong, corresponding to those of the pulp, from which it seems to be derived. This inner pulp is much fouler than the other, and has none of the small grains interspersed thro' it; and hence it has got the name of *acetary*.

Between the acetary and outer pulp, the globules or grains begin to grow larger, and gradually unite into a hard stony body, especially towards the corculum, or floor of the fruit; and from this circumstance it has been called the *calculus*.

These grains are not derived from any of the organical parts of the tree; but seem rather to be a kind of concretions precipitated from the sap, similar to the precipitations from wine, urine, and other liquors.

The core is a roundish cavity in the centre of the pear, lined with a hard woody membrane, in which

Plant.

Plate

which the seed is inclosed. At the bottom of the core there is a small duct or canal, which runs up to the top of the pear; this canal allows the air to get into the core, for the purpose of drying and ripening the seeds.

Fig. 4. A longitudinal section of the pear, shewing a different view of the same parts with those of fig. 1. A, the channel, or duct, which runs from the top of the pear to the bottom of the core.

In a *lemon*, the parenchyma appears in three different forms. The parenchyma of the rind is of a coarse texture, being composed of thick fibres, woven into large bladders. Those nearest the surface contain the essential oil of the fruit, which bursts into a flame when the skin is squeezed over a candle. From this outmost parenchyma nine or ten infertions or lamellæ are produced, which run between as many portions of the pulp, and unite into one body in the centre of the fruit, which corresponds to the pith in trunks or roots. At the bottom and top of the lemon, this pith evidently joins with the rind, without the intervention of any lamellæ. This circumstance shows, that the pith and bark are actually connected in the trunk and roots of plants, though it is difficult to demonstrate the connection, on account of the closeness of their texture, and the minuteness of their fibres. Many vessels are dispersed thro' the whole of this parenchyma; but the largest ones stand on the inner edge of the rind, and the outer edge of the pith, just at the two extremities of each lamella.

The second kind of parenchyma is placed between the rind and the pith; it is divided into distinct bodies by the lamellæ; and each of these bodies forms a large bag.

These bags contain a third parenchyma, which is a cluster of smaller bags, distinct and unconnected with each other, having a small stalk by which they are fixed to the large bag. Within each of these small bags are many hundreds of bladders, composed of extremely minute fibres. These bladders contain the acid juice of the lemon.

Plate

*Of the Perspiration of PLANTS, and the quantity of*

*moisture daily imbibed by them.*—These curious particulars have been determined with great accuracy by Dr Hales. The method he took to accomplish his purpose was as follows.—In the month of July, commonly the warmest season of the year, he took a large sun-flower three feet and an half high, which had been purposely planted in a flower-pot when young. He covered the pot with thin milled lead, leaving only a small hole to preserve a communication with the external air, and another by which he might occasionally supply the plant with water. Into the former he inserted a glass tube nine inches long, and another shorter tube into the hole by which he poured in the water; and the latter was kept close stoppered with a cork, except when there was occasion to use it. The holes in the bottom of the pot were also stoppered up with corks, and all the crevices shut with cement.—Things being thus prepared, the pot and plant were weighed for 15 several days; after which the plant was cut off close to the leaden plate, and the stump well covered with cement. By weighing, he found that there perspired through the unglazed porous pot two ounces every 12 hours; which being allowed for in the daily weighing of the plant and pot, the greatest perspiration, in a warm day, was found to be one pound 14 ounces; the middle rate of perspiration, one pound four ounces: the perspiration of a dry warm night without any sensible dew, was about three ounces; but when there was any sensible though small dew, the perspiration was nothing; and when there was a large dew, or some little rain in the night, the plant and pot was increased in weight two or three ounces.

In order to know what quantity was perspired from a square inch of surface, our author cut off all the leaves of the plant, and laid them in five several parcels, according to their several sizes; and then measured the surface of a leaf of each parcel, by laying over it a large lattice made with threads, in which each of the little squares were  $\frac{1}{4}$  of an inch; by numbering of which, he had the surface of the leaves in square inches; which, multiplied by the number of leaves in the corresponding parcels, gave the area of all the leaves. By this method he found the surface of the whole plant above ground to be 5616 square inches, or 39 square feet. He dug up another sun-flower of nearly the same size, which had eight main roots, reaching 15 inches deep and sideways, from the stem. It had besides a very thick bush of lateral roots from the eight main roots, extending every way in a hemisphere about nine inches from the stem and main roots. In order to estimate the length of all the roots, he took one of the main roots with its laterals, and measured and weighed them; and then weighed the other seven with their laterals; by which means he found the sum of all their lengths to be 1448 feet. Supposing then the periphery of these roots at a medium to be 0.131 of an inch, then their surface will be 2276 square inches, or 15.8 square feet; that is, equal to 0.4 of the surface of the plant above ground. From calculations drawn from these observations it appears, that a square inch of the upper surface of this plant perspires  $\frac{1}{16}$  part of an inch in a day and a night; and that a square inch of the surface underground imbibed  $\frac{1}{4}$  of an inch in the same time.

Plant.

The quantity perspired by different plants, however, is by no means equal. A vine-leaf perspires only  $\frac{1}{100}$  of an inch in 12 hours; a cabbage perspires  $\frac{1}{20}$  of an inch in the same time; and an apple-tree  $\frac{1}{10}$  in 12 hours; and a lemon  $\frac{1}{10}$  in 12 hours.

*Of the Circulation of the Sap in Plants.*—Concerning this there have been great disputes; some maintaining, that the vegetable sap has a circulation analogous to the blood of animals; while others affirm, that it only ascends in the day-time, and descends again in the night. In favour of the doctrine of circulation it has been urged, that upon making a transverse incision into the trunk of a tree, the juice which runs out, proceeds in greater quantity from the upper than the lower part; and the swelling in the upper lip is also much greater than in the lower. It appears, however, that when two similar incisions are made, one near the top, and the other near the root, the latter expends much more sap than the former. Hence it is concluded, that the juice ascends by one set of vessels, and descends by another. But, in order to shew this clearly, it would be necessary, first to prove, that there is in plants, as in animals, some kind of centre from which the circulation begins, and to which it returns: but no such centre has been discovered by any naturalist; neither is there the least provision apparently made by nature whereby the sap might be prevented from descending in the very same vessels thro' which it ascends. In the lacteal vessels of animals, which we may suppose to be analogous to the roots of vegetables, there are valves which effectually prevent the chyle when once absorbed from returning into the intestines; but no such thing is observed in the vessels of vegetables; whence it must be very probable, that when the propelling force ceases, the juice descends by the very same vessels through which it ascended. This matter, however, has been cleared up almost as well as the nature of the subject will admit of by the experiments of Dr Hales †. These experiments are so numerous, that for a particular account of them we must refer to the work itself; however, his reasoning against the circulation of the sap will be sufficiently intelligible without them. “We see, (says he), in many of the foregoing experiments, what quantities of moisture trees daily imbibe and perspire: now the celerity of the sap must be very great, if that quantity of moisture must, most of it, ascend to the top of the tree, then descend, and ascend again, before it is carried off by perspiration.

“The defect of a circulation in vegetables seems in some measure to be supplied by the much greater quantity of liquor, which the vegetable takes in, than the animal, whereby its motion is accelerated; for we find the sun-flower, bulk for bulk, imbibes and perspires 17 times more fresh liquor than a man, every 24 hours.

“Besides, Nature's great aim in vegetables being only that the vegetable life be carried on and maintained, there was no occasion to give it the rapid motion which was necessary for the blood of animals.

“In animals, it is the heart which sets the blood in motion, and makes it continually circulate; but in vegetables we can discover no other cause of the sap's motion, but the strong attraction of the capillary sap-

vessels, assisted by the brisk undulations and vibrations caused by the sun's warmth, whereby the sap is carried up to the top of the tallest trees, and is there perspired off thro' the leaves: but when the surface of the tree is greatly diminished by the loss of its leaves, then also the perspiration and motion of the sap is proportionably diminished, as is plain from many of the foregoing experiments: so that the ascending velocity of the sap is principally accelerated by the plentiful perspiration of the leaves, thereby making room for the fine capillary vessels to exert their vastly attracting power, which perspiration is effected by the brisk rarefying vibrations of warmth; a power that does not seem to be any ways well adapted to make the sap descend from the tops of vegetables by different vessels to the root.

“If the sap circulated, it must needs have been seen descending from the upper part of large gashes cut in branches set in water, and with columns of water pressing on their bottoms in long glass tubes. In both which cases, it is certain that great quantities of water passed through the stem, so that it must needs have been seen descending, if the return of the sap downwards were by trusion or pulsion, whereby the blood in animals is returned through the veins to the heart: and that pulsion, if there were any, must necessarily be exerted with prodigious force, to be able to drive the sap through the finer capillaries. So that, if there be a return of the sap downwards, it must be by attraction, and that a very powerful one, as we may see by many of these experiments. But it is hard to conceive, what and where that power is, which can be equivalent to that provision nature has made for the ascent of the sap in consequence of the great perspiration of the leaves.

“The instances of the jessamine-tree, and of the passion-tree, have been looked upon as strong proofs of the circulation of the sap, because their branches, which were far below the inoculated bud, were gilded: but we have many visible proofs in the vine, and other bleeding trees, of the sap's receding back, and pushing forwards alternately, at different times of the day and night. And there is great reason to think, that the sap of all other trees has such an alternate, receding, and progressive motion, occasioned by the alternacies of day and night, warm and cool, moist and dry.

“For the sap in all vegetables does probably recede in some measure from the tops of the branches, as the sun leaves them; because its rarefying power then ceasing, the greatly rarefied sap, and air mixed with it, will condense, and take up less room than they did, and the dew and rain will then be strongly imbibed by the leaves; whereby the body and branches of the vegetable which have been much exhausted by the great evaporation of the day, may at night imbibe sap and dew from the leaves; for by several experiments, plants were found to increase considerably in weight, in dewy and moist nights. And by other experiments on the vine, it was found, that the trunk and branches of vines were always in an imbibing state, caused by the great perspiration of the leaves, except in the bleeding season; but when at night that perspiring power ceases, then the contrary imbibing power will prevail, and draw the sap and dew from the leaves, as well

Plant.

well as moisture from the roots.

"And we have a farther proof of this by fixing mercurial gages to the stems of several trees which do not bleed, whereby it is found that they are always in a strongly imbibing state, by drawing up the mercury several inches: whence it is easy to conceive, how some of the particles of the gilded bud in the inoculated jessamine may be absorbed by it, and thereby communicate their gilding miasma to the sap of other branches; especially when, some months after the inoculation, the stock of the inoculated jessamine is cut off a little above the bud; whereby the stock, which was the counteracting part to the stem, being taken away, the stem attracts more vigorously from the bud.

"Another argument for the circulation of the sap, is that some sorts of the grafts will infect and canker the stocks they are grafted on: but by mercurial gages fixed to fresh-cut stems of trees, it is evident that those stems were in a strongly imbibing state; and consequently the cankered stocks might very likely draw sap from the graft, as well as the graft alternately from the stock; just in the same manner as leaves and branches do from each other, in the vicissitudes of day and night. And this imbibing power of the stock is so great, where only some of the branches of a tree are grafted, that the remaining branches of the stock will, by their strong attraction, starve those grafts; for which reason it is usual to cut off the greatest part of the branches of the stock, leaving only a few small ones to draw up the sap.

"The instance of the ilex grafted upon the English oak, seems to afford a very considerable argument against a circulation. For, if there were a free uniform circulation of the sap through the oak and ilex, why should the leaves of the oak fall in winter, and not those of the ilex?

"Another argument against an uniform circulation of the sap in trees, as in animals, may be drawn from an experiment where it was found by the three mercurial gages fixed to the same vine, that while some of its branches changed their state of protruding sap into a state of imbibing, others continued protruding sap one nine, and the other thirteen days longer."

To this reasoning of Dr Hales we shall subjoin an experiment made by Mr Muffel of the Academy of Sciences at Rouen, which seems decisive against the doctrine of circulation. His account of it is as follows.—"On the 12th of January I placed several shrubs in pots against the windows of my hot-house, some within the house, and others without it. Thro' holes made for this purpose in the panes of glass, I passed a branch of each of the shrubs, so that those on the inside had a branch without, and those on the outside one within; after this, I took care that the holes should be exactly closed and luted. This inverse experiment, I thought, if followed closely, could not fail affording sufficient points of comparison, to trace out the differences, by the observation of the effects.

"The 20th of January, a week after this disposition, all the branches that were in the hot-house began to disclose their buds. In the beginning of February there appeared leaves; and towards the end of it, shoots of a considerable length, which presented the young flowers. A dwarf apple-tree, and several

rose-trees, being submitted to the same experiment, shewed the same appearance then as they commonly put on in May; in short, all the branches which were within the hot-house, and consequently kept in the warm air, were green at the end of February, and had their shoots in great forwardness. Very different were those parts of the same tree which were without and exposed to the cold. None of these gave the least sign of vegetation; and the frost, which was intense at that time, broke a rose-pot placed on the outside, and killed some of the branches of that very tree which, on the inside, was every day putting forth more and more shoots, leaves, and buds, so that it was in full vegetation on one side, whilst frozen on the other.

"The continuance of the frost occasioned no change in any of the internal branches. They all continued in a very brisk and verdant state, as if they did not belong to the tree which, on the outside, appeared in the state of the greatest suffering. On the 15th of March, notwithstanding the severity of the season, all was in full bloom. The apple-tree had its root, its stem, and part of its branches, in the hot-house. These branches were covered with leaves and flowers; but the branches of the same tree, which were carried on the outside, and exposed to the cold air, did not in the least partake of the activity of the rest, but were absolutely in the same state which all trees are in during winter. A rose-tree, in the same position, showed long shoots with leaves and buds; it had even shot a vigorous branch upon its stalk; whilst a branch which passed through, to the outside, had not begun to produce anything, but was in the same state with other rose-trees left in the ground. This branch is four lines in diameter, and 18 inches high.

"The rose-tree on the outside was in the same state; but one of its branches drawn through to the inside of the hot-house, was covered with leaves and rose-buds. It was not without astonishment that I saw this branch shoot as briskly as the rose-tree which was in the hot-house, whose roots and stalk, exposed as they were to the warm air, ought, it should seem, to have made it get forwarder than a branch belonging to a tree, whose roots, trunk, and all its other branches, were at the very time frost-nipped. Notwithstanding this, the branch did not seem affected by the state of its trunk; but the action of the heat upon it produced the same effect, as if the whole tree had been in the hot-house.

9. *Of the Food of PLANTS.*—This hath been so fully discussed under the article AGRICULTURE †, that it † Part I. remains here only to take notice of those discoveries <sup>sect. 1.</sup> which have been made since that article was written.—The method of making dephlogisticated *air de novo*, or of depriving common air of its phlogiston, is now so much improved, that numberless experiments may be made with it both on animals and vegetables. It is now pretty clear, that these two parts of the creation are a kind of counterbalance to one another; and the noxious parts or excrements of the one prove salutary food to the other. Thus, from the animal body continually pass off certain effluvia, which *phlogificate* the air. Nothing can be more prejudicial to animal life than an accumulation of these effluvia: on the other hand, nothing is more favourable to vegetables than those excrementitious effluvia of animals; and accordingly

cordingly they greedily absorb them from the earth, or from the air. With respect to the excrementitious parts of living vegetables, the case is reversed. The purest dephlogisticated air is the common effluvia which passes off from vegetables; and this, however favourable to animal life, is by no means so vegetable; whence we have an additional proof of the doctrine concerning the food of plants delivered under the article AGRICULTURE.

With regard to the effects of other kinds of air on vegetation, a difference of some consequence took place between Dr Priestley and Dr Percival. The former, in the first volume of his Experiments and Observations on Air, had asserted that fixed air is fatal to vegetable as well as to animal life. This opinion, however, was opposed by Dr Percival, and the contrary one adopted by Dr Hunter of York in the Geographical Essays, vol. V. The experiments related by these two gentlemen would indeed have been decisive, had they been made with sufficient accuracy. That this was the case, however, Dr Priestley denies, and in the third volume of his Treatise on Air has fully detected the mistakes in Dr Percival's experiments; which proceeded in fact from his having used, not fixed air, but common air mixed with a small quantity of fixed air. His experiments, when repeated with the purest fixed air, and in the most careful manner, were always attended with the same effect, namely, the killing of the plant.

It had also been asserted by Drs Percival and Hunter, that water impregnated with fixed air was more favourable to vegetation than simple water. This opinion was likewise examined by Dr Priestley: however, his experiments were indecisive; but seem rather unfavourable to the use of fixed air than otherwise.

Another very remarkable fact with regard to the food of plants has been discovered by Dr Priestley; namely, that some of them, such as the willow, comfrey, and duck-weed, are nourished by inflammable air. The first, he says, flourishes in this species of air so remarkably, that, "it may be said to feed upon it with great avidity. This process terminates in the change of what remains of the inflammable air into phlogisticated air, and sometimes into a species of air as good as common air, or even better; so that it must be the *inflammable principle* in the air that the plant takes, converting it, no doubt, into its proper nourishment."

From what has been said under the article PHLOGISTON, it must appear evident, that phlogisticated air and inflammable air are closely allied to each other, so that it is no wonder they should serve promiscuously for the food of plants. The reason why both are not agreeable to all kinds of plants: most probably is the different quantity of phlogistic matter contained in them, and the different action of the latent fire they contain: for all plants do not require an equal quantity of nourishment; and such as require but little, will be destroyed by having too much. The action of heat also is essentially necessary to vegetation, and it is probable that very much of this principle is absorbed from the air by vegetables. But if the air by which plants are partly nourished contains too much of that principle, it is very probable that they may be

VOL. VIII.

destroyed from this cause as well as the other; and thus inflammable air, which contains a vast quantity of that active principle, may destroy such plants as grow in a dry soil, though it preserves those which grow in a wet one. See VEGETATION.

*Diffusion of PLANTS.*—So great are the prolific powers of the vegetable kingdom, that a single plant almost of any kind, if left to itself would, in a short time, over-run the whole world. Indeed, supposing the plant to have been only a single annual, with two seeds, it would, in 20 years, produce more than a million of its own species; what numbers then must have been produced by a plant whose seeds are so numerous as many of those with which we are acquainted? From a single root of the helonium (balsard sun-flower), Laurembergius reckons 3000 seeds; from the zea, 2000; which in Virginia must be doubled, because the plant is there sown twice a year. In the helianthus (sun-flower), 4000 seeds were observed by Camerarius; and in a poppy, Trevins numbered 3200 seeds: but of all others the tobacco seems to produce the greatest number of seeds, 40320 being counted from a single plant.

If nature had appointed no means for the scattering of these numerous seeds, but allowed them to fall down in the place where they grew, the young vegetables must of necessity have choked one another as they grew up, and not a single plant could have arrived at perfection. But so many ways are there appointed for the dissemination of plants, that we not only see they not hinder each others growth, but a single plant will in a short time spread through different countries. The most evident means for this purpose are,

1. The force of the air.—That the efficacy of this may be the greater, nature has raised the seeds of vegetables upon stalks, so that the wind has thus an opportunity of acting upon them with the greater advantage. The seed-capsules also open at the apex, lest the ripe seeds should drop out without being widely dispersed by the wind. Others are furnished with wings, and a pappous down, by which, after they come to maturity, they are carried up into the air, and have been known to fly the distance of 50 miles: 138 genera are found to have winged seeds.

2. In some plants the seed-vessels open with violence when the seeds are ripe, and thus throw them to a considerable distance; and we have an enumeration of 50 genera whose seeds are thus dispersed.

3. Other seeds are furnished with hooks, by which, when ripe; they adhere to the coats of animals, and are carried by them to their lodging places. Linnæus reckons 50 genera armed in this manner.

4. Many seeds are dispersed by means of birds, and other animals; who pick up the berries, and afterwards eject the seeds uninjured. Thus the fox disseminates the privet, and man many species of fruit. The plants found growing upon walls and houses, on the tops of high rocks, &c. are mostly brought there by birds; and it is universally known, that by manuring a field with new dung, innumerable weeds will spring up, which did not exist there before: 193 species are reckoned up which may be disseminated in this manner.

5. The growth of other seeds is promoted by ani-

Plant.

imals in a different way. While some are eaten, others are scattered and trodden into the ground by them. The squirrel gnaws the cones of the pine, and many of the seeds fall out. When the loxica eats off their bark, almost his only food, many of their seeds are committed to the earth, or mixed in the morafs with mofs, where he had retired. The glandularia, when she hides up her nuts, often forgets them, and they strike root. The fame is observable of the walnut; mice collect and bury great quantities of them, and being afterwards killed by different animals, the nuts germinate.

6. We are astonished to find mofses, fungi, byffus, and mucor, growing every-where; but it is for want of reflecting that their seeds are so minute that they are almost invifible to the naked eye. They float in the air like atoms, and are dropped every-where, but grow only in thofe places where there was no vegetation before, and hence we find the fame mofses in North America and in Europe.

7. Seeds are alfo difperfed by the ocean, and by rivers. "In Lapland, (fays Linnæus), we fee the moft evident proofs how far rivers contribute to deposit the seeds of plants. I have feen Alpine plants growing upon their shores frequently 36 miles diftant from the Alps; for their feeds falling into the rivers, and being carried along and left by the ftream, take root there.—We may gather likewife from many circumftances how much the fea furthers this bufinefs.—In Rollagia, the ifland of Græfœa, Oeland, Gothland, and the shores of Scanis, there are many foreign and German plants not yet naturalized in Sweden. The centaury is a German plant, whose feeds being carried by the wind into the fea, the waves landed this foreigner upon the coasts of Sweden. I was aftonished to fee the veronica maritima, a German plant, growing at Tornea, which hitherto had been found only in Græfœa: the fea was the vehicle by which this plant was tranfported thither from Germany; or poffibly it was brought from Germany to Græfœa, and from thence to Tornea. Many have imagined, but erroneoufly, that feed corrupts in water, and lofes its principle of vegetation. Water at the bottom of the fea is feldom warm enough to deftroy feeds; we have feen water cover the furface of a field for a whole winter, while the feed which it contained remained unhurt, unlefs at the beginning of fpring the waters were let down fo low by drains, that the warmth of the fun-beams reached to the bottom. Then the feeds germinate, but prefently become putrefcent; fo that for the reft of the year the earth remains naked and barren. Rain and fhowers carry feeds into the cracks of the earth, ftreams, and rivers; which laft, conveying them to a diftance from their native places, plant them in a foreign foil."

8. Laftly, fome feeds affift their projection to a diftance in a very furprifing manner. The crupina, a fpecies of centaury, has its feeds covered over with erect bristles, by whose affiftance it creeps and moves about in fuch a manner, that it is by no means to be kept in the hand. If you confine one of them between the ftoeking and the foot, it creeps out either at the fleeve or neck-band, travelling over the whole body. If the bearded oat, after harveft, be left with other grain in the barn, it extricates itfelf from the glumes,

nor does it ftop in its progrefs till it gets to the walls of the building. Hence, fays Linnæus, the Dacæcarlian, after he has cut and carried it into the barn, in a few days finds all the glumes empty, and the oats feperate from them; for every oat has a fpiral arifta or beard annexed to it, which is contracted in wet, and extended in dry weather. When the fpiral is contracted, it drags the oat along with it: the arifta being bearded with minute hairs pointing downward, the grain neceffarily follows it; but when it expands again, the oat does not go back to its former place, the roughnefs of the beard the contrary way preventing its return. If you take the feeds of equifetum, or fern, thefe being laid upon paper, and viewed in a microfcope, will be feen to leap over any obftacle as if they had feet; by which they are feperated and difperfed one from another; fo that a perfon ignorant of this property, would pronounce thefe feeds to be fo many mites or fmall infects. See NATURAL HISTORY, SECT. III.

PLANTS growing on Animals. See INSECTS giving root to Plants.

Method of Drying and Preferving PLANTS for Botanifts. Many methods have been devised for the prefervation of plants; we fhall relate only thofe that have been found moft fuccefsful.

First prepare a prefs, which a workman will make by the following direftions. Take two planks, of a wood not liable to warp. The planks mult be two inches thick, 18 inches long, and 12 inches broad. Get four male and four female fcrews, fuch as are commonly ufed for fecuring fafh-windows. Let the four female fcrews be let into the four corners of one of the planks, and correffponding holes made through the four corners of the other plank for the male fcrews to pafs through, fo as to allow the two planks to be fcrewed tightly together. It will not be amifs to face the bearing of the male fcrews upon the wood with iron plates; and if the iron plates went acrofs from corner to corner of the wood, it would be a good fecurity againft the warping.

Secondly, get half a dozen quires of large foft fpongy paper, fuch as the ftationers call *blossom blotting paper* is the beft, and a few fheets of ftrong paff-board.

The plants you wifh to prefereve fhould be gathered in a dry day, after the fun hath exhaled the dew; taking particular care to collect them in that ftate where in their generic and fpecific characters are moft confpicuous. Carry them home in a tin-box nine inches long, four inches and a half wide, and one inch and a half deep. Get the box made of the thinnest tinned iron that can be procured; and let the lid open upon hinges. If any thing happens to prevent the immediate ufe of the fpecimens you have collected, they will be kept freffh two or three days in this box much better than by putting them in water. When you are going to prefereve them, fuffer them to lie upon a table until they become limber; and then they fhould be laid upon a paff-board, as much as poffible in their natural form, but at the fame time with a particular view to their generic and fpecific characters. For this purpose it will be advifeable to feperate one of the flowers, and to difplay the generic character. If the fpecific character depends upon the flower or upon the

root,

Plant.

Botanical  
Arrangement,  
P. xlixii.

Plant.

root, a particular display of that will be likewise necessary. When the plant is thus disposed upon the pasteboard, cover it with eight or ten layers of spongy paper, and put it into the press. Exert only a small degree of pressure for the first two or three days; then examine it, unfold any unnatural plaits, rectify any mistakes, and, after putting fresh paper over it, screw the press harder. In about three days more separate the plant from the pasteboard, if it is sufficiently firm to allow of a change of place; put it upon a fresh pasteboard, and, covering it with fresh blossom-paper, let it remain in the press a few days longer. The press should stand in the sun-shine, or within the influence of a fire.

When it is perfectly dry, the usual method is to fasten it down, with paste or gum-water, on the right-hand inner page of a sheet of large strong writing-paper. It requires some dexterity to glue the plant neatly down, so that none of the gum or paste may appear to defile the paper. Press it gently again for a day or two, with a half sheet of blossom-paper betwixt the folds of the writing-paper. When it is quite dry, write upon the left-hand inner page of the paper the name of the plant; the specific character; the place where, and the time when, it was found; and any other remarks you may think proper. Upon the back of the same page, near the fold of the paper, write the name of the plant, and then place it in your cabinet. A small quantity of finely powdered arsenic, or corrosive sublimate, is usually mixed with the paste or gum-water, to prevent the devastations of insects; but the seeds of slaves-acre finely powdered will answer the same purpose, without being liable to corrode or to change the colour of the more delicate plants. Some people put the dried plants into the sheets of writing-paper, without fastening them down at all; and others only fasten them by means of small slips of paper, pasted across the stem or branches. Where the species of any genus are numerous, and the specimens are small, several of them may be put into one sheet of paper.

Another more expeditious method is to take the plants out of the press after the first or second day; let them remain upon the pasteboard; cover them with five or six leaves of blossom-paper, and iron them with a hot smoothing-iron until they are perfectly dry. If the iron is too hot, it will change the colours; but some people, taught by long practice, will succeed very happily. This is quite the best method to treat the orchis and other slimy mucilaginous plants.

Another method is to take the plants when fresh gathered, and, instead of putting them into the press, immediately to fasten them down to the paper with strong gum-water: then dip a camel-hair pencil into spirit-varnish, and varnish the whole surface of the plant two or three times over. This method succeeds very well with plants that are readily laid flat, and it preserves their colours better than any other. The spirit varnish is made thus. To a quart of highly rectified spirit of wine, put five ounces of gum sandarach; two ounces of mastic in drops; one ounce of pale gum elemi, and one ounce of oil of spike-lavender. Let it stand in a warm place, and shake it frequently to expedite the solution of the gums.

Where no better convenience can be had, the spe-

cimens may be disposed systematically in a large folio book; but a vegetable cabinet is upon all accounts more eligible. In Plate CCXLVI. there is a section of a cabinet, in the true proportions it ought to be made, for containing a complete collection of British plants. By the assistance of this drawing, and the adjoining scale, a workman will readily make one. The drawers must have backs and sides, but no other front than a small ledge. Each drawer will be 14 inches wide, and 10 inches from the back to the front, after allowing half an inch for the thickness of the two sides, and a quarter of an inch for the thickness of the back. The sides of the drawers, in the part next the front, must be sloped off in a serpentine line, something like what the workmen call an *ogee*. The bottoms of the drawers must be made to slide in grooves cut in the uprights, so that no space may be lost betwixt drawer and drawer. After allowing a quarter of an inch for the thickness of the bottom of each drawer, the clear perpendicular space in each must be as in the following table.

I. Two tenths of an inch.	XIV. Three inches and eight tenths.
II. One inch and two tenths.	XV. Three inches and four tenths.
III. Four inch, and six tenths.	XVI. One inch and three tenths.
IV. Two inches and three tenths.	XVII. Two inches and eight tenths.
V. Seven inches and eight tenths.	XVIII. Six tenths of an inch.
VI. Two inches and two tenths.	XIX. Ten inches.
VII. Two tenths of an inch.	XX. One inch and nine tenths.
VIII. One inch and four tenths.	XXI. Four inches and four tenths.
IX. Two tenths of an inch.	XXII. Two inches and six tenths.
X. Two inches and eight tenths.	XXIII. One inch and two tenths.
XI. One inch and two tenths.	XXIV. Seventeen inches.
XII. Three inches and five tenths.	
XIII. Two inches and four tenths.	

This cabinet shuts up with two doors in front; and the whole may stand upon a base, containing a few drawers for the reception of duplicates and papers.

*Moving PLANT.* See HEDYSARUM.

*Sensitive PLANT.* See MIMOSA and SENSITIVE PLANT.

*PLANT-Lice, Vine-fretters, or Pucerons.* See Aphis.

*PLANTA, a PLANT.* See PLANT.

*PLANTA Feminine*, a female plant, is one which bears female flowers only. It is opposed to a *male* plant, which bears only male flowers; and to an *androgynous* one, which bears flowers of both sexes.—Female plants are produced from the same feed with the male, and arrange themselves under the class of diccia in the sexual method.

*PLANTAGENET*, the surname of the kings of England from Henry II. to Richard III. inclusive. Antiquarians are much at a loss to account for the origin of this name; and the best derivation they can find for it is, that Fulk, the first earl of Anjou of that name, being stung with remorse for some wicked action, went in pilgrimage to Jerusalem as a work of atonement; where being soundly scourged with broom-twigs, which grew plentifully on the spot, he ever after took the surname of *Plantagenet*, or *broom stalk*, which was retained by his noble posterity.

*PLANTAGO*, *PLANTAIN*; a genus of the monogynia order, belonging to the tetrandria class of plants. To this genus Linnæus has joined the coronopus

Plant

Plantago.

**Plantago** and pyllium of Tournesort. The first of these is called *hartshorn*, the latter *seawort*. Of these there are several distinct species, and some varieties; but as they are rarely cultivated in gardens, we shall not enumerate them here, and shall only mention such of them as grow naturally in Britain. Of the plantain there are the following sorts: The common broad-leaved plantain, called *weybread*; the great hoary plantain, or lambs-tongue; the narrow-leaved plantain, or ribwort; and the following varieties have also been found in England, which are accidental; the below-plantain and rose-plantain. The plantains grow naturally in pastures in most parts of England, and are frequently very troublesome weeds. The common plantain, and ribwort plantain, are both used in medicine, and are so well known as to need no description. They are said to be slightly astringent; and the green leaves are commonly applied to fresh wounds by the common people.

Of the coronopus, or buckshorn plantain, there are two varieties growing in England, viz. the common buckshorn, which grows plentifully on heaths every where; and the narrow-leaved Welch sort, which is found upon many of the Welch mountains. The first of these was formerly cultivated as a salad herb in gardens, but has been long banished from thence for its rank disagreeable flavour; it is sometimes used in medicine.—There has been one species of pyllium or seawort found growing naturally in England, which is the sort used in medicine. This was found in the earth thrown out of the bottom of the canals which were dug for the Chelsea water-works, where it grew in great plenty. The seeds of this must have been buried there some ages; for no person remembers any of the plants growing in that neighbourhood before. The seeds of this are sometimes used, which are imported from the south of France.

**PLANTAIN.** See **PLANTAGO**.

**PLANTAIN Tree.** See **MUSA**.

**PLANTATION**, in the West Indies, denotes a spot of ground which a planter, or person arrived in a new colony, pitches on to cultivate for his own use, or is assigned for that purpose. However, the term *plantation* is often used in a term synonymous with colony. See **COLONY**.

**PLANTERSHIP**, in a general sense, the business of a planter.

**PLANTERSHIP**, in the West Indies, denotes the management of a sugar plantation, including not only the cultivation of the cane, but the various processes for the extraction of the sugar, together with the making of sugar-spirits. See **RUM**, **SACCHARUM**, and **SUGAR**.

To effect a design so comprehensive, it is necessary for a planter to understand every branch of the art precisely, and to use the utmost attention and caution both in the laying down and executing of his plans. It is therefore the duty of a good planter to inspect every part of his plantation with his own eyes; to place his provisions, stores, and utensils, in regular order, and in safe repositories; that by preserving them in perfection, all kinds of waste may be prevented.

But as negroes, cattle, mules, and horses, are, as it were, the nerves of a sugar-plantation, it is expected to treat that subject with some accuracy.

[Of Negroes, Cattle, &c.] In the first place, then, as it

is the interest of every planter to preserve his negroes in health and strength; so every act of cruelty is not less repugnant to the master's real profit, than it is contrary to the laws of humanity: and if a manager considers his own ease, and his employer's interest, he will treat all negroes under his care with due benevolence; for good discipline is by no means inconsistent with humanity: on the contrary, it is evident from experience, that he who feeds his negroes well, proportions their labour to their age, sex, and strength, and treats them with kindness and good-nature, will reap a much larger product, and with infinitely more ease and self-satisfaction, than the most cruel task-master, who starves his negroes, or chastises them with undue severity. Every planter then who wishes to grow rich with ease, must be a good economist; must feed his negroes with the most wholesome food, sufficient to preserve them in health and vigour. Common experience points out the methods by which a planter may preserve his people in health and strength. Some of his most fruitful land should be allotted to each negro in proportion to his family, and a sufficient portion of time allowed for the cultivation of it; but because such allotment cannot in long droughts produce enough for his comfortable support, it is the incumbent duty of a good planter to have always his stores well filled with Guinea corn, yams, or eddoes, besides potatoes growing in regular succession: for plenty begets cheerfulness of heart, as well as strength of body; by which more work is effected in a day by the same hands, than in a week when enervated by want and severity. Scanty meals may sustain life; but it is evident, that more is requisite to enable a negro, or any other person, to go through the necessary labours. He therefore who will reap plentifully, must plant great abundance of provisions as well as sugar-canes: and it is nature's economy so to fructify the soil by the growth of yams, plantains, and potatoes, as to yield better harvests of sugar, by that very means, than can be produced by many other arts of cultivation. Plantains are the principal support of all the negroes at Jamaica; and are also much cultivated, at great expence of manure, in Barbadoes; but ought not to be solely depended upon in climates subject to hurricanes. A celebrated planter and economist of the last-mentioned island, who raised an immense fortune from very small beginnings only by planting, affirmed, that he fed constantly at least 300 negroes out of 12 acres of plantains. How that excellent produce came to be so long neglected in some of the islands, is hard to guess; but at present the neglect seems to be founded upon a vulgar error, that plantains cannot thrive in any other than low moist soils. In such places (no doubt) they flourish most luxuriantly; but yet they thrive and bear fruit abundantly on mountains and in marshes, and in the driest black mold upon marble or rocks, and even in sharp gravelly soils, as may be evinced by numberless instances.

However plenty of wholesome food may be conducive to health, there are also other means, equally necessary to strength and the longevity of negroes, well worth the planter's attention: and those are, to choose airy dry situations for their houses; and to observe frequently that they be kept clean, in good repair, and perfectly water-tight; for nastiness, and the inclemencies of weather, generate the most malignant diseases.

Plantership. If these houses are situated also in regular order, and at due distances, the spaces may at once prevent general devastations by fire, and furnish plenty of fruits and pot-herbs, to please an unvitiated palate, and to purify the blood. Thus then ought every planter to treat his negroes with tenderness and generosity, that they may be induced to love and obey him out of mere gratitude, and become real good beings by the imitation of his behaviour; and therefore a good planter, for his own ease and happiness, will be careful of setting a good example.

Having thus hinted the duties of a planter to his negroes, let the next care be of cattle, mules, and horses. The planters of Barbadoes (who are perhaps the most skilful of all others, and exact to a nicety in calculations of profit and loss) are, with respect to their cattle, the most remiss of any in all the islands; as if the carriage of canes to the mill, and of plantation-produce to the market, was not as essential as any other branch of plantership. At Barbadoes, in particular, the care of these animals is of more importance; because the soil, worn out by long culture, cannot yield any produce without plenty of dung. Some planters are nevertheless so ingeniously thrifty, as to carry their canes upon negroes heads; acting in that respect diametrically opposite to their own apparent interest, which cannot be served more effectually than by saving the labour of human hands, in all cases where the labour of brutes can be substituted; and for that end, no means of preserving those creatures in health and strength ought to be neglected.

The first care therefore is to provide plenty and variety of food. In crop-time, profusion of cane-tops may be had for the labour of carriage; but they will be more wholesome and nutritious if tedded like hay by the sun's heat, and sweated by laying them in heaps a few days before they are eaten. In this season of abundance, great ricks of cane-tops (the butt ends turned inwards) should be made in the most convenient corner of each field, to supply the want of pasturage and other food: and these are very wholesome if chopped into small parts, and mixed sometimes with common salt, or sprinkled with molasses mixed with water: but yet the cattle require change of food to preserve them in strength; such as Guinea corn, and a variety of grafs, which every soil produces with a little care in moist weather; and indeed this variety is found necessary in all climates.

But since that variety is not to be had during those severe droughts to which hot climates are liable, and much less in those small islands which cannot furnish large tracts of meadow-lands for hay, the only resource is the fodder of cane-tops or tedded Guinea-corn leaves; which are very nutritious, and may be preserved in perfection for more than a whole year, provided the tops or Guinea-corn are well tedded for three or four hot days as they lie spread in the field; and then, being tied into bundles or sheaves, must lie in the hot sun for three or four days more, when they may be fit to be put up into ricks. The best method of making them is in an oblong figure, about 30 feet in length, and 16 or 18 feet wide; seven feet high at the sides, and from thence sloping like the roof of an house, the ridge of which must be thatched very carefully; for the sides may be secured from wet

by placing the bundles with the butts upwards towards Plantership. the ridge, in couries, and lapping the upper over the lower course.

The best method of forming those ricks, is to place the first course of bundles all over the base one way; the second course reverfly; and so alternately till the rick be finished.

When cattle are to be fed with this fodder, it must be observed to take down the bundles from the top, at the west end of the rick, to the bottom; for all these ricks must stand east and west lengthwise, as well to secure them from being overturned by high winds, as for the convenience of preferring them from wet, which cannot be done when ricks are made round. By this husbandry, an herd of cattle may be kept in strength, either in severe droughts, or in wet seasons, when grafs is purgative: and thus the necessity or expence of large pastures may be totally saved. The hay-knife used in England for cutting hay, answers for cutting ricks of tops.

The method of tedding Guinea-corn to make a kind of hay, will require a little explanation here. When Guinea corn is planted in May, and to be cut down in July, in order to bear feed that year, that cutting, tedded properly, will make an excellent hay, which cattle prefer to meadow-hay. In like manner, after Guinea corn has done bearing seed, the after-crop will furnish a great abundance of that kind of fodder which will keep well in ricks for two or three years.

The next care of a planter is to provide shade for his cattle; either by trees where they are fed in the heat of the day, if his soil requires not dung; or by building a flat shade over the pen where cattle are confined for making it. That such shades are essentially necessary to the well being of all animals in hot weather, is apparent to every common observer, who cannot fail of seeing each creature forsaking the most luxuriant pastures in the heat of the day, for the sake of shade; thus convincing the owners by instinctive argument, that shade is almost as necessary to the well-being of the brute creatures, as food. Yet, notwithstanding that demonstration from the unerring course of nature, throughout all our islands (except in a very few instances) these poor creatures are exposed to the scorching sun-beams without mercy. Such inhuman neglect is not always so much the effect of inattention, as of a mistaken notion that shades are impediments to the making of much dung; but a flat shade covered with cane-trash, may be so made as to let rain pass through it, without admission of sun-beams. This will do for cattle; but mules, which are spirited creatures, and work themselves by draught into a foaming heat, should be put into a warm stable, until quite cool: for turning them loose to pasture when so hot, is probably the cause of their destruction by the glanders.

If the care of providing shade for brute creatures is so much the duty and interest of their owners, how much more is it agreeable to the laws of humanity to provide shade for human creatures travelling upon the high roads in this hot climate? Nothing surely of so much beauty, costs so little expence as planting cocoanut or spreading timber trees in avenues along the highways, if each proprietor of the lands adjoining hath any taste of elegance, or feeling for other men: but both those kinds of trees will yield also great profit to the

*Plantership.* the proprietor, by furnishing him with timber, when perhaps not otherwise to be had; or with a delicious milk, fitted by nature to cool the effervescence of the blood in this hot region; and also to improve the spirits made from sugar to the delicacy and softness of arrack. Cocoa-nut, and cabbage trees are both very beautiful and shady, bearing round heads of great expansion, upon natural trunks, or pillars of elegant proportion, and of such an height as to furnish a large shade, with a free circulation of air equally refreshing to man and beast.

The common objection of injury to canes by the roots of such trees growing on their borders, may be easily removed by digging a small trench between the canes and trees, which may intercept their roots, and oblige them to seek sustenance in the common road. Let it also be considered, besides the benefits above suggested, that the planter will thus beautify his estate to the resemblance of a most sumptuous garden. And probably that very beauty might not only render the islands more healthful to the inhabitants, by preserving them from fevers kindled by the burning sun-beams, but also much more fruitful by seasonable weather: for as, by cutting down all its woods, an hot country becomes more subject to excessive droughts; so by replanting it in the manner above described, it would probably become more seasonable.

Let then the planter be kind not only to his fellow-creatures, but merciful to his beasts; giving them plenty and variety of wholesome food, clear water, cool shade, and a clean bed, bleeding them after a long course of hard labour, currying their hides from filth and ticks (A); affording them salt, and other physick, when necessary; protecting them from the flogging ropes of a cruel driver (who needs no other instrument than a goad); proportioning their labour to their strength; and by every art rendering their work as easy as possible. The general management of planters is not, perhaps, more defective in any other respect than in this: for, by pairing the cattle unequally, and by the drivers ill conduct in writhing to the right and left, the poor creatures are fatigued by needless labour. An horse ought therefore to be harnessed before them as a leader. This docile creature, by being led in a straight line, will soon learn to be an unerring guide, and the cattle will follow in the same direction with united strength, and consequently with more effect and less fatigue to each individual.

The Portuguese of Madeira, by their poverty and scantiness of pasture, breed the smallest kind of cattle; and yet one yoke of them will draw a much greater weight than a pair of our largest oxen, solely by an equal exertion of their joint strength. That equality or evenness of draught is preserved by boring gimblet holes through their horns, within two inches of the points, and running a thong of leather through those holes, so as to tie the horns of each pair at six inches distance from each other. By this ligature the pair of cattle are absolutely hindered from turning different ways, and draw in an even direction with united

force. Thus it appears evidently from reason, as well *Plantership.* as from experience, that the labour of our beasts may, by a little contrivance, be rendered more easy and effectual.

*Of the Culture of various Soils.* In the British sugar-colonies there is as great a variety of soils as in any country of Europe; some naturally very rich or fruitful, yielding a luxuriant product with little labour or culture. This fruitful soil is of three kinds: a loose hazel mould mixed with sand, like that of St Christopher's, and is the best in the known world for producing sugar in great quantity, and of the best quality. The brick mould of Jamaica is somewhat of the same nature, and next in value; and then the various mixtures of mould and gravel, to be found in veins or flats over all the other islands. When any of these soils are exhausted of their fertility by long and injudicious culture, they may be restored by any kind of dung well rotted; for these (A) warm soils cannot bear hot unrotten dung, without being laid fallow for a considerable time after it. Another improvement is by sea-sand or sea-weed; or by digging in the cane-trash into steep lands, and by letting it lie to rot for some months. A third method is, by ploughing and laying it fallow; and the fourth method (the best of all), is by folding the fallows by sheep. But this can be practised only where there are extensive pastures; nor can the plough be employed where the soil abounds with large stones. In that case, however, the former method of digging in trash will be nearly as effectual, tho' more expensive, by hand-labour, or hoe-ploughing.

The next best soil for producing good sugar, is a mould upon clay, which if shallow, requires much culture and good labour, or its produce will be small in quantity, though of a strong grain and bright colour, so as to yield most profit to the refiner of any sugar, except that produced from an hazel or gravelly soil, as before mentioned. All the black-mould soils upon marle are generally fruitful, and will take any kind of dung; but yield not so strong or large-grained sugar. Marle, however, of a white, yellow, or blue colour, or rich mould from washes, or ashes of every kind, are excellent for every strong soil, as the chief ingredient in the compost of dung: either of them will do alone for stiff lands; but the yellow and chocolate marle are the most soapy, and the richest kind of manure (except fine mould) for all stiff lands. If these are well opened, pulverized by culture, and mixed with hot dung, or any kind of loose earth or marle, they will produce as plentifully as lighter soils: and all kinds of clay soils, except that of a white colour, have these two advantages above the finest gravel soils, that they do not scorch soon by dry weather, and never grow weary of the same manure, as most other soils do.

The extraordinary hand-labour bestowed in making dung, may be saved by the art of caving, now in general use in England. Ten mules or horses, and two light tumbrels with broad wheels, and ten able negroes, may, by the common use of spades, shovels, and light

(A) One pound of native sulphur, a quart of lamp-oil, and the like quantity of hog's-lard, intimately mixed and made into an ointment, is a cure for the mange, lice, &c.

(B) These soils which are naturally loose and upon marle, Mr Martin calls *hot soils*; and these, he says, have been much injured in some of the islands by dung hastily made with marle: but if the sediment of lees were thrown into these pens, after being turned over, it would much improve the dung.

Plantership-light mattocks, or grubbing-hoes, make more dung than 60 able negroes can do in the present methods.

If marle lies upon rising ground, or in hillocks, as it often does, the pit is to be opened at the foot of the declivity; which being dug inwards, till the bank is three feet high, then it is to be *caved* thus. Dig an hollow space of 12 or 18 inches deep under the foot of the bank; then dig into each side of it, another perpendicular cut of the same depth, and 18 inches wide, from the top of the bank to the bottom: that being finished, make a small trench a foot or two from the brink of the bank; pour into it water till full; and when that is done, fill it again, till the water soaking downward makes the marle separate and fall down all at once. This may be repeated till the pit rises to 50 feet high; and then many hundreds of cart-loads of marle may be thrown down by four negroes in two hours; from whence it may be carted into cattle-pens, or laid out upon lands, as occasion requires. Five or six negroes with spades or shovels will keep two or three tumbrils employed, according to the distance of cartage: and thus as much dung may be made by ten negro men, as will dung richly at least 70 or 80 acres of land every year, and laid out also with the assistance of cattle-carts: An improvement highly worth every planter's consideration, when negroes, and feeding them are so expensive; and this is no speculation, but has been confirmed by practice. In level lands, the same operation may be as effectual, provided the mouth of the pit be opened by gradual descent to any depth: but when marle is to be found on the side of hills, the operation is less laborious for the horses. But if the surface of the marle-pits (as it often happens) be covered with clay, or stiff soil, so that the water cannot quickly soak from the trench above; in that case, pieces of hard wood, made like piles, four feet long, and four inches square, pointed at one end, and secured at the other square head, by an iron clamp, may be driven by heavy mauls into the trench, as so many wedges, which will make the caved part tumble down: but a skilful eye must watch the last operation, or the labourers may be buried or hurt.

But then clay-foils that are level, and subject to be drowned, or to retain water in stagnated pools, can never be made fruitful by any kind of manure, without being first well drained: for water lying upon any foil will moist certainly transform it to a stiff unfruitful clay; as appears evidently by the bogs of Ireland, the fens of Lincoln and Cambridgeshire, and even by the ponds of Barbadoes situated in the deepest and lightest black mould; for that fine foil being washed into those ponds, becomes the stiffest black clay, not fit even for an ingredient in dung, until it has been laid dry, and exposed to the sun for a whole year: but when these bogs and fens are well drained, they become the most fruitful soils. Natural clay the celebrated Boerhaave thinks the fattest of all soils; but then it must be opened by culture, marle, or sandy manures. It is hard to conjecture how the opinion prevailed in the British plantations, that sandy gut-mould was most unfit for clay-foils, as being the means of binding them to the compactness of brick; whereas it is proved, from long experience, to be one of the best means of opening clay-foils, and rendering them abundantly fruitful. Brick is made of *clay alone*; no sand being used in

it, farther than to sprinkle the board on which it is moulded into shape. From repeated experience, it appears, that a mixture of sand in gut-mould is the best of all manure for stiff and barren clay-lands; provided they be well drained, by throwing the whole soil into round ridges of 12 feet wide, with furrows of three feet wide between each ridge. And this is done with little more hand-labour than that of hoe-ploughing well in the common way. For if a piece of land be marked in lines at seven feet and a half distance from each other, and the labourers are fet in to hoe-plough at the second line, halling back each clod 12 inches; half the ridge, and near half the furrow, is made at the same time: and thus a piece of land may be round-ridged, and the furrows all made at once, by the common operation of hoe-ploughing, provided the digger drives his hoe up to the eye at every stroke. Hoe-ploughing in clay-foils that have lain long under water, is indeed hard labour; but it will every year grow the lighter by being well drained by round-riding; and in the mean while the labour may be rendered much more easy by the plough conducted by the lines above described. As therefore sandy mould is the best manure for stiff clay; so by parity of reason, confirmed by long experience, stiff clay is the best manure for sandy or chaffy soils.

The method of round-riding before described, is, by several years experience, found the most essential improvement of flat clayey soils: and yet there are some who will prefer speculation to ocular demonstration, fancying that all kinds of ridges will carry off the mould in heavy rains. The fact is otherwise in clay-foils: and plain reason, without experience, vouches, that where great confluxes of water are divided into many small rills, the force is broken; and therefore less mould carried off the land. Another objection made to round-riding, is, that by digging much clay to form the sides of the ridge, the soil is impoverished; but this objection stands good only against those ridges which are raised too high, and made too broad; but if land is ridged in the manner before directed, that is, 12 feet broad, and not above six or eight inches higher in the middle than at the sides, the objection vanishes.

Ridges were never proposed for light soils or steep lands; and even in flat soils upon loam they should be made with great caution, because *loam melts away by water*. But there are poachy lands of a white clay, even upon small descents, too retentive of water; these may certainly be improved much by ridges of 12 feet wide, as above described, without fear of washes.

But supposing, as the objection urges, that a little clay should be turned up at the sides of such ridges; can it not be manured somewhat more than the other parts, with marle, or sandy mould, so as to become equally good with any other part of the soil? And is not this well worth the labour, since round-riding not only improves the foil by draining it to a surprising degree, but adds one fifth part to the depth of the staple? And will not a ridge made a little rounding, throw off the water much better than a flat ridge?

The general maxim of not burning cane-trash (which may be called the *stable of cane-lands*) upon any kind of foil, is surely a great mistake; as may be evinced by observing the contrary practice of the best husbandmen

Plantership men in England, where burn-baiting or baitard burn-baiting, is found by experience an admirable method of fertilizing cold, stiff, or clayey lands. It must indeed be a constant practice, not only for the sake of contributing to warm and divide the soil, but as the only effectual means of destroying pernicious insects, and weeds of various kinds, such as French weed, wild pea, and wild vines.

Soon after the disse of burning trash upon our lands in this island, the blast made its first appearance with incredible devastation: to revive that practice therefore seems to be the most obvious means of expelling it. It may be presumed that the disse of burning trash was founded upon the mistaken notion of burn-baiting, which is turning up a thick sod of very dry, light, and shallow soils, and burning the whole superficies, or staple, to ashes. This practice the writers upon husbandry condemn universally, and very justly: for though by this practice the land will produce two or three crops more plentifully than ever, yet the soil is blown away by the wind, and the substratum being generally an hungry gravel, or chalk, can never be restored to fertility by the common arts of husbandry. But surely this has no resemblance to our superficial burning of the little trash we can spare from dung: and though this method of burn-baiting light and shallow soils be justly condemned, yet the best writers recommend that very practice, in cold, moist, and heavy soils, as is observed above; and long experience justifies it.

Deep mould upon clay or loam, being subject to the grub-worm (c), will not take any kind of dung, till perfectly rotten, except that of the sheep-fold; which is the best manure for all kinds of light soils; and is of all others the least expensive, as not requiring hand-labour. But the use of the fold is impracticable in any island not abounding with large savannas, or sheep-pastures, as in Jamaica.

Those soils therefore which are subject to the grub, and must be fertilized by common dung, which is a proper nest for the mother-beetle to deposit its eggs, must be well impregnated with the brine of dissolved salt, after the dung is first cut up; two large hog-heads of salt will make brine enough for a dung-pen of 50 feet square.

This cure for the grub is a late discovery; and which has been attended with success, so far as the experiment is made. But though it proves effectual to destroy that pernicious insect in plant-canes, it probably will not be sufficient to save rattoons, without a new application of salt in powder; because the first brine must be washed away, by the time when rattoons spring up.

The planter who would save his rattoons from the grub, ought therefore to cut off the heads of his stools with sharp hoes three inches below the surface of the soil, and then strew an handful of salt round each stool, and cover it up to a level with fine mold taken from the edges.

In soils where there is no grub, and the planter

wishes to have very good rattoons, let him, as soon as his canes are cut, draw all the trash from the stools into the alternate spaces, if planted in that manner; or into the furrows, if his land be round-ridged; and then cut off the head of his stools with sharp hoes, as above directed. Experience has shown the advantage of this practice, and reason demonstrates the great benefit of the rattoon-sprouts rising from three inches below the surface, instead of superficial shoots which came to nothing, and only starve the strong sprouts. Besides, the stubbs which are left upon the stools after the canes are cut, canker, and rot the stools; which is one reason why good rattoons are uncommon in soils long cultivated. Yet it is the opinion of some, that by hoe-ploughing and even dunging rattoons, the produce might be as good as plant-canes, which would save the labour of holing and planting so often as planters commonly do.

Following is of incredible advantage to every soil, not only by being divided into the minutest parts, but also by imbuing those vegetative powers, with which the air is impregnated by the bountiful hand of Providence, whenever rain falls. What those powers are, has been explained under the articles AGRICULTURE and PLANT; and experience evinces, that the tender vegetables of the earth are enervated more by the smallest shower of rain, than by all the water which human art can bestow. Let it therefore be a constant maxim of the planter, never to plant his ground until the soil is well mellowed by following, even though he bestows upon it a due proportion of dung: we lay a due proportion; for too much will force up rank canes, which never yield good sugar; and though some advantage may be reaped from the rattoons, yet it will be found by experience not to compensate the loss by the plants. In stony or steep soils, where the plough cannot be supported for that purpose, hand-labour or hoe-ploughing must be substituted: but even in that case, much labour may be saved by spreading the dung according to the English husbandry, and digging it into the soil. To evince this truth, let any planter compute his negroes labour of distributing dung by baskets, and by spreading it with dung-forks; and then judge for himself by one single experiment, which is the most profitable.

But if some planters are so devoted to the old custom of distributing dung by baskets, instead of wheelbarrows in level ground, or hand-barrows in uneven land, by which three times the labour may be accomplished in the same time and by the same hands; let them at least save much of their hand-labour, by the following method of laying out dung, before the distribution by baskets.

In holing a piece of land, let a space be left after 80 holes from the first interval, and then the like space after 80 holes throughout the whole plat, which spaces must run exactly parallel to the intervals on the right and left of the holes. Into these spaces the dung may be carted, even before it be rotten (d), at the most

(c) This pernicious insect is most apt to engender in dung made from mill-trash, which therefore never ought to be put into dung-compost, or still-ponds; but after being burnt, the ashes will be as good as any other kind. Round-riding, with manure of unweat ashes, sea-sand, or lime, or dry marie, kills the grub.

(d) In order to make dung rot the sooner, much labour is bestowed in digging and turning it over by hoes: but

Planterſhip. moſt leiſure times, and overed with mould, or cane-  
traſh, to prevent exhalation; and in ſuch quantity  
as will ſuffice only to dung a row of 40 holes, from  
the point oppoſite to each ſide of it. In the inter-  
vals at each ſide of the cane-piece, which are parallel  
to thoſe ſpaces, there muſt be dung enough carted  
to manure a row of 40 holes, and covered in like  
manner.

By thus placing the dung or gut-mould, it is evi-  
dent at the firſt ſight, that the fartheſt diſtance can-  
not be above 40 holes in diſtributing the dung: and  
in caſe it be not ſufficiently rotten for preſent uſe, it  
may be diſtributed even in dry weather, and covered  
by the bank; which will both prevent its ſpirit from  
exhalation, and occaſion it to rot ſooner, which is no  
ſmall advantage. Moreover, by being thus laid out  
at the moſt leiſure times, and covered with the banks,  
the dung will be more intimately mixed with the ſoil,  
and therefore continue to nourish the plant for a longer  
time than if laid as uſual at the bottom of the holes.  
A farther advantage of thus diſtributing the dung, and  
covering it, reſults from the more expeditious planting  
the land, after a ſhort or ſudden ſhower: for the la-  
bour of covering the dung, and uncovering it when the  
land is planted, however it may appear in ſpecula-  
tion, is in practice a triſle; and beſides all the other  
advantages ariſing by the diſtribution of dung from  
the ſpaces above deſcribed, this is not the leaſt, that  
not a bank is trodden under foot. But it is evident,  
that by diſtributing the dung with baſkets in the pre-  
ſent method, the ſoil is much trampled under foot;  
and by that means, the very end of hoe-ploughing, or  
loofening the ſoil, is much defeated. In like manner,  
by the preſent method of hoe-ploughing, the ſame ill  
effect is produced; for as the negroes hoe-plough or  
dig the ſoil directly forward, ſo they muſt neceſſarily  
tread the ground as faſt as they dig it: whereas, by  
putting the labourers to dig ſidewiſe, no one puts a  
foot upon the ſoil after it is dug; and by lining the  
land before it is hoe-ploughed, each negroe may have  
an equal ſhare to dig. The only difficulty of hoe-  
ploughing ſidewiſe is in firſt ſetting the negroes to  
that work; but may be done without loſs of time  
when working in a contiguous field. Whether hoe-  
ploughing before or after the land be holed for canes,  
is moſt eligible, experience muſt determine; but cer-  
tainly both operations will be moſt effectual: and there-  
fore it will be adviſeable (1), firſt to plough the ſoil  
where the land will admit the plough; and where it  
will not, to hoe-plough it with, or without dung, as  
requiſite; then let it lie fallow till perfectly mellowed;  
then hole and plant it; and inſtead of weeding in the  
uſual manner, let the weeds in all the ſpaces be dug  
into the ſoil: but as this is not to be done ſo well with  
the hoe, it is ſubmitted to future experience, whether  
the dexterous uſe of ſpades, as in England, will not  
anſwer the purpoſe much better, and with equal diſ-  
patch. But whatever method is preferred, moſt cer-  
tain it is, that by loofening the ſoil in all the ſpaces

VOL. VIII.

between the young canes after being come up, their Planterſhip.  
fibres will more eaſily expand on every ſide, and ac-  
quire more nutrition to enervate their growth. But  
where the planter grudges this labour, by thinking it  
needleſs in a rich looſe ſoil, he may diſpatch more  
weeding-work by the Dutch hoe, than by any other;  
which being faſtened upon the end of a ſtick, is puſh-  
ed forward under the roots of the ſmall weeds, in ſuch  
a manner as to cut them up a little below the ſurface  
of the ſoil, and will do more execution at one ſhove  
than can be done at three ſtrokes of the common hoe:  
but there is yet another practice of the horſe-hoe  
plough, whereby all weeds growing in rows between  
beans and peafe, are extirpated with incredible eaſe and  
expedition. It is a very ſimple machine, drawn by one  
or two horſes, conſiſting of a pair of low wheels turn-  
ing upon a common axis; from whence two ſquare  
irons are let down at equal diſtances, and triangular  
hoes made at the ends, the points of the triangles be-  
ing placed forward, and ſo fixed as to cut all weeds  
an inch below the ſurface, in the ſame manner as the  
Dutch garden-hoe abovementioned. By this machine  
a man and a boy, with two horſes or mules, will clear  
perfectly all the ſpaces of a field of ten acres in two  
days, and may be of admirable uſe in all looſe and dry  
ſoils in the ſugar-iſlands: for while two horſes or  
mules draw in the ſpace before each other, the wheels  
paſs on the outside of each row of canes, without do-  
ing the leaſt injury, while the plough-holder attends to  
his buſineſs. In ſtiff ſoils which require draining,  
neither the horſe-hoe plough nor the Dutch hoe can  
be proper; or any other inſtrument ſo effectual as the  
ſpade uſed in the manner above hinted, where the  
ſtifle is deep.

But where the ſtifle of land is ſhallow, care muſt  
be taken not to dig much below it, according to the  
univerſal opinion of all the beſt writers, ſupported by  
the experience of 100 years. Yet ſome good planters  
are fallen into the contrary practice, and dig up ſtiff  
clay far below the ſtifle. This, Mr Martin ſays, was  
done in his own lands, during his abſence, by injudi-  
ciously ploughing below the ſtifle; and ſo injured the  
ſoil, that all the arts of culture for many years hard-  
ly retrieved its former fertility. Indeed where the  
ſtifle is ſhallow, upon a fat clay, there turning up a  
little of it at a time, from the bottom of the cane-  
holes, and mixing it with rich hot dung, made of  
marle, or ſandy mud, which may take off its cohesive  
quality, will in due time, and by long fallow, be con-  
verted into good ſoil: but if ſtiff clay be turned up,  
without any ſuch mixture, in large quantities, it will  
infallibly diſappoint the operator's hopes: for though  
ſolid clay will moulder, by expoſure, to a ſeeming fine  
earth, yet it will return to its primitive ſtate, very ſoon  
after being wet, and covered from the external air, if  
not divided, as above ſuggeſted.

After all, the common horſe-hoeing plough drawn  
by two mules in a line before each other, or the  
hand-hoe in common uſe, will anſwer the purpoſe

35 A

very

two-thirds of that labour may be ſaved by the uſe of hay-knives, fix of which, uſed dexterouſly, will cut up a pen in  
leſs time than 60 negroes can do by hoes: but hay-knives cannot be uſed where gritty mould is uſed in pens.

(1) Deep and looſe ſoils may be ploughed with a ſmall ſtrength of cattle or mules: but ſtiff lands in hot climates  
require more ſtrength of cattle than can be maintained in the ſmall paſtures of the planters; for if thoſe ſtrong ſoils  
are either too wet or too dry (as is generally the caſe), ploughing is impracticable.

*Planter*hip, very well, where the lands are planted in Mr Tull's method; that is, where the spaces are equal to the land planted, in the following manner.

Suppose six feet planted in two rows of canes, and six feet of land left as a space unplanted; and so a whole piece of land, planted in alternate double rows (F), with equal spaces, may be hoe-ploughed with ease, as before hinted; and that at any time during the growth of canes, when it is most convenient to the planter, which is a considerable advantage; and yet it is the least of all attending this method of culture: for, by leaving these spaces, the canes will have both more air and sun: by hoe-ploughing them, the roots of each double row will have large room for expansion, and consequently, by gaining more nutriment, will grow more luxuriantly: by these spaces the canes may be cleaned from the blast with much more ease and convenience; and will serve as proper beds to plant great corn, without the least injury to the canes; as well as to contain the trash taken off the land, where, by rotting, and being hoe-ploughed into the soil, it will be wonderfully enriched, and well fitted to be planted immediately after the canes in the neighbouring double rows are cut down. Besides all these admirable advantages of planting the land in alternate double rows with equal spaces, the canes, when at full age, may be easily stripped of their trash, and by that means the juice rendered so mature as to yield double the produce, and much better sugars than unstripped canes. This method of culture may be recommended for all kinds of soil: for as by this practice the rank luxuriant canes will be more matured, so the poor soils will be rendered more fruitful; and as the roots of the canes which expand into these spaces, will be kept moist by being covered with rotten trash, so they must bear dry weather much longer in the burning soils. In those low lands which require draining by furrows, the alternate double rows and spaces must be made cross the ridges; by which means, those spaces, being hoe-ploughed from the centre to the sides, will be always preserved in a proper state of roundness. By this method of planting, the canes may be so well ripened as to yield double the quantity of sugar, of canes planted in the close manner; which saves half the labour of cartage, half the time of grinding and boiling, and half the fuel, besides yielding finer sugar.

Yet, how well soever the method of planting in single or double alternate rows has succeeded in the loose and stiff soils, experience has shown that it is a wrong practice in stiff lands that are thrown into round or flat ridges: for these being most apt to crack, the sun-beams penetrate soon to the cane-roots, stop their growth, and have an ill influence upon the sugar. It is therefore advisable to plant such lands full, but in large holes, of 4 feet, by 5 feet towards the banks: after the plant-canes are cut, to dig out one, and leave two

rows standing, hoe-ploughing the spaces after turning *Planter*hip all the trash into furrows till almost rotten: for if the trash is drawn upon the hoe-ploughed spaces, they will hardly ever moulder; at least not till the trash is quite rotten. This is an infallible proof from experience, of how little advantage trash is to the soil, unless it be in great droughts, to keep out the intense sun-beams: for, in all other respects, it prevents that joint operation of the sun and air in mouldering and fructifying the soil, as has been proved by repeated experiments.

But in stiff soils that are properly drained by round-ridging, no culture prevents cracking so effectually as hoe-ploughing into them a quantity of loose marl, of which that of a chocolate or of a yellow colour is best; and will be still much better, by lying upon the land, in small heaps, or in cane-holes, for some time, to imbibe the vegetative powers of the air, before it is intimately mixed with the soil.

As to the manner of planting canes, the general practice of allowing four feet by five to an hole, and two fresh (G) plants, is found by common experience to be right and good in alternate rows. But the following precautions are necessary to be observed. First, let all the cane-rows run east and west, that the trade-wind may pass freely through them; because air and sunshine are as conducive to the growth and maturation of sugar-canes, as any other vegetable. Secondly, let not any accession of mould be drawn into hills round the young canes, except where water stagnates (H); because the fibres which run horizontally, and near the surface, are much broken and spoiled by that practice. Thirdly, let the sugar-canes be cut at their full maturity; which, in a dry loose soils, is generally at the end of 14 or 15 months after being planted; but in cold clay-soils, not till 16 or 17 months. Fourthly, as the cane-rows run east and west in as proper a direction as possible for cartage to the sugar-work, so canes must be cut the contrary way if the planter expects any great produce from his ratoon: for by beginning to cut canes at the part of his field most remote from the works, the carts cannot often pass over the same track, and consequently the cane-stools cannot be injured, more especially if he takes due care to cut the canes very close to their roots; for, by leaving a long stub, (which must perish) the cane-stools are much injured. It may be objected to the practice of the cuttings cane transversely to the rows, that the negroes labour will not be so equally divided: but let every man consider both sides of the question, and be determined by his own experience; and then he will be convinced, that it matters very little which way he cuts straight standing canes; but in cases where the sugar-canes lean, or are lodged by preceding high winds, it is a point of great importance to place the labourers so as to cut the canes first at the roots, and then, drawing them, cut off the tops: for thus by two strokes each cane will be

(F) In stiff lands, the single alternate rows of four feet distance, as preventive of much labour in weeding, are found best; and also yield more sugar by the acre; and are less apt to be affected by drought.

(G) It is an odd fancy that stale plants grow best, when both reason and experience vouch that the most succulent plants are best: one good plant in the centre of a large hole is sufficient when the land is full holed.

(H) The stagnation of water in pools (usual in stiff level lands) is the most injurious circumstance attending it; for that, by long duration, will convert the finest mould to stiff clay. The proprietor of such a soil must therefore grudge no labour to drain it well; and yet by such easy gradation, as to prevent the mould from being washed away by great floods, in case the under stratum is a loam.

**Planterſhip** be cut; and twice the quantity cut in the ſame time, and by the ſame hands, more than by cutting in any other direction. In round-ridged land, it is proper to cut canes in the ſame direction of the ridges, throwing the tops and traſh into the furrows to render the cartage eaſy, and to preſerve the ridges in their proper form.

It is almoſt needleſs to ſuggeſt the expediency of planning the cane-pieces of a plantation in exact ſquares, ſo that the intervals may be perfect at right angles; ſince ſuch regularity is not only more beautiful, more ſafe in caſe of accidental fires, and a better diſpoſition of the whole for dividing and planting one third or fourth part of a plantation every year, but alſo much eaſier guarded by a few watchmen: for one of theſe walking in a line from eaſt to weſt, and the other from north to ſouth, look through every avenue, where the moſt ſubtile thief cannot eſcape the watchful eye. And if the intervals ſurrounding the boundary of a regular plantation be made 24 feet wide, the proprietor will receive ample recompenſe for ſo much land, by the ſecurity of his canes from fires kindled in the neighbourhood, and by planting all that land in plantain-trees, which may at once yield food and ſhade to the watchmen, who by that means can have no excuſe for an abſence from their proper ſtations. But as fuel grows very ſcarce in moſt of our iſlands, it is alſo expedient to plant a logwood or flower-fence in all the boundaries of every plantation, which, being cut every year, will furniſh good ſtore of faggots. Logwood makes the ſtrongeſt and quickeſt of all fences, and agrees with every ſoil: the cuttings make excellent oven-fuel.

So much for the general operations of planterſhip, according to the approved directions of Mr Martin. For the particular cultivation of the ſugar-canes, the extraction of the ſugar, and the diſtillation of rum, ſee the articles SACCARUM, SUGAR, and RUM.

**PLANTIN** (Chriſtopher), a celebrated printer, was born near Tours in 1533, and bred to an art which he carried to the hiſheſt degree of perfection. He went and ſettled at Antwerp; and there erected a printing-office, which was conſidered not only as the chief ornament of the town, but as one of the moſt extraordinary edifices in Europe. A great number of ancient authors were printed here; and theſe editions were valued not only for the beauty of the characters, but alſo for the correſtneſs of the text, with regard to which Plantin was ſo very nice, that he procured the moſt learned men to be correctors of his preſs. He got imenſe riches by his profeſſion; which however he did not hoard up, but ſpent like a gentleman. He died in 1598, aged 65 years; and left a moſt ſumptuous and valuable library to his grandſon Balhaſar.

**PLANTING**, in agriculture and gardening, is ſetting a tree or plant, taken from its proper place, in a new hole or pit; throwing freſh earth over its root, and filling up the hole to the level of the ſurface of the ground.

The firſt thing in planting is to prepare the ground before the trees or plants are taken out of the earth, that they may remain out of the ground as ſhort a time as poſſible; and the next is, to take up the trees or plants, in order to their being tranſplanted. In taking up the trees, carefully dig away the earth round

the roots, ſo as to come at their ſeveral parts to cut them off; for if they are torn out of the ground without care, the roots will be broken and bruited, to the great injury of the trees. When you have taken them up, the next thing is to prepare them for planting by pruning the roots and heads. And firſt, as to the roots; all the ſmall fibres are to be cut off, as near to the place from whence they are produced as may be, except they are to be replanted immediately after they are taken up. Then prune off all the bruited or broken roots, all ſuch as are irregular and croſs each other, and all downright roots, eſpecially in fruit-trees: ſhorten the larger roots in proportion to the age, the ſtrength, and nature of the tree; obſerving that the walnut, mulberry, and ſome other tender-rooted kinds, ſhould not be pruned ſo cloſe as the more hardy ſorts of fruit and foreſt trees: in young fruit-trees, ſuch as pears, apples, plumbs, peaches, &c. that are one year old from the time of their budding or grafting, the roots may be left only about eight or nine inches long; but in older trees, they muſt be left of a much greater length: but this is only to be underſtood of the larger roots; for the ſmall ones muſt be chiefly cut quite out, or pruned very ſhort. The next thing is the pruning of their heads, which muſt be differently performed in different trees; and the deſign of the trees muſt alſo be conſidered. Thus, if they are deſigned for walls or eſpaliers, it is beſt to plant them with the greateſt part of their heads, which ſhould remain on till they begin to ſhoot in the ſpring, when they muſt be cut down to five or ſix eyes, at the ſame time taking care not to diſturb the roots. But if the trees are deſigned for ſtandards, you ſhould prune off all the ſmall branches cloſe to the place where they are produced, as alſo the irregular ones which croſs each other; and after having diſplaced theſe branches, you ſhould alſo cut off all ſuch parts of branches as have by any accident been broken or wounded; but by no means cut off the main leading ſhoots which are neceſſary to attraſt the ſap from the root, and thereby promote the growth of the tree. Having thus prepared the trees for planting, you muſt now proceed to place them in the earth: but firſt, if the trees have been long out of the ground, ſo that the fibres of the roots are dried, place them eight or ten hours in water, before they are planted, with their heads erect, and the roots only immerſed therein; which will ſwell the dried veſſels of the roots, and prepare them to imbibे nourishment from the earth. In planting them, great regard ſhould be had to the nature of the ſoil: for if that be cold and moiſt, the trees ſhould be planted very ſhallow; and if it be a hard rock or gravel, it will be better to raiſe a hill of earth where each tree is to be planted, than to dig into the rock or gravel, and fill it up with earth, as is too often praſtiſed, by which means the trees are planted as it were in a tub, and have but little room to extend their roots. The next thing to be obſerved is, to place the trees in the hole in ſuch a manner that the roots may be about the ſame depth in the ground as before they were taken up; then break the earth fine with a ſpade, and ſcatter it into the hole, ſo that it may fall in between every root, that there may be no hollowneſs in the earth: then having filled up the hole, gently tread down the earth with your feet, but do

Planting?

Planting  
Plashing.

not make it too hard; which is a great fault, especially if the ground be strong or wet. Having thus planted the trees, they should be fastened to stakes driven into the ground to prevent their being displaced by the wind, and some mulch laid upon the surface of the ground about their roots; as to such as are planted against walls, their roots should be placed about five or six inches from the wall, to which their heads should be nailed to prevent their being blown up by the wind. The seasons for planting are various, according to the different sorts of trees, or the soil in which they are planted. For the trees whose leaves fall off in winter, the best time is the beginning of October, provided the soil be dry; but if it be a very wet soil, it is better to defer it till the latter end of February, or the beginning of March: and for many kinds of evergreens, the beginning of April is by far the best season; though they may be safely removed at Midsummer, provided they are not to be carried very far; but should always make choice of a cloudy wet season.

*Reverse PLANTING*, a method of planting in which the natural position of the plant or shoot is inverted; the branches being set into the earth, and the root reared into the air. Dr Agricola mentions this monstrous method of planting, which he found to succeed very well in moist or all sorts of fruit-trees, timber-trees, &c. Bradley affirms that he has seen a lime-tree in Holland growing with its first roots in the air, which had shot out branches in great plenty, at the same time that its first branches produced roots and fed the tree. Mr Fairchild, of Hoxton, has practised the same with us, and gives the following directions for performing it: Make choice of a young tree of one shoot, of alder, elm, willow, or any other tree that easily takes root by laying; bend the shoot gently down into the earth, and so let it remain till it has taken root. Then dig about the first root, and raise it gently out of the ground, till the stem be nearly upright, and stake it up. Then prune the roots, now erected in the air, from the bruises and wounds they received in being dug up; and anoint the pruned parts with a composition of two ounces of turpentine, four ounces of tallow, and four ounces of bees wax, melted together, and applied pretty warm. Afterwards prune off all the buds or shoots that are upon the stem, and dress the wounds with the same composition, to prevent any collateral shootings, that might spoil the beauty of the stem.

*PLANUDES* (Maximus), a Greek monk of Constantinople, towards the end of the 14th century, who published a collection of epigrams intitled *Anthologia*; a Greek translation of Ovid's *Metamorphoses*; a *Life of Æsop*, which is rather a romance than a history; and some other works. We know nothing more of him, than that he suffered some persecution on account of his attachment to the Latin church.

*PLASHING* of *QUICKSET-HEDGES*, an operation very necessary to promote the growth and continuance of old hedges. See the article *HEDGE*.

It is performed in this manner: The old stubs must be cut off, &c. within two or three inches of the ground; and the best and longest of the middle-sized shoots must be left to lay down. Some of the strong-

est of these must also be left to answer the purpose of stakes. These are to be cut off to the height at which the hedge is intended to be left; and they are to stand at ten feet distance one from another: when there are not proper shoots for these at the due distances, their places must be supplied with common stakes of dead wood. The hedge is to be first thinned, by cutting away all but those shoots which are intended to be used either as stakes, or the other work of the plashing; the ditch is to be cleaned out with the spade; and it must be now dug as at first, with sloping sides each way; and when there is any cavity on the bank on which the hedge grows, or the earth has been washed away from the roots of the shrubs, it is to be made good by facing it, as they express it, with the mould dug from the upper part of the ditch: all the rest of the earth dug out of the ditch is to be laid upon the top of the bank: and the owner should look carefully into it that this be done; for the workmen, to spare themselves trouble, are apt to throw as much as they can upon the face of the bank; which being by this means overloaded, is soon washed off into the ditch again, and a very great part of the work undone; whereas what is laid on the top of the bank always remains there, and makes a good fence of an indifferent hedge.

In the plashing the quick, two extremes are to be avoided; these are, the laying it too low, and the laying it too thick. The latter makes the sap run all into the shoots, and leaves the plashes without sufficient nourishment; which, with the thickness of the hedge, finally kills them. The other extreme of laying them too high, is equally to be avoided; for this carries up all the nourishment into the plashes, and so makes the shoots small and weak at the bottom, and consequently the hedge thin. This is a common error in the north of England. The best hedges made any where in England, are those in Hertfordshire; for they are plashed in a middle way between the two extremes, and the cattle are by that prevented both from cropping the young shoots, and from going through; and a new and vigorous hedge soon forms itself.

When the shoot is bent down that is intended to be plashed, it must be cut half way through with the bill: the cut must be given sloping, somewhat downwards, and then it is to be wound about the stakes, and after this its superfluous branches are to be cut off as they stand out at the sides of the hedge. If for the first year or two, the field where a new hedge is made can be ploughed, it will thrive the better for it; but if the stubs are very old, it is best to cut them quite down, and to secure them with good dead hedges on both sides, till the shoots are grown up from them strong enough to plash; and wherever void spaces are seen, new sets are to be planted to fill them up. A new hedge raised from sets in the common way, generally requires plashing in about eight or nine years after.

*PLASTER*, in pharmacy, an external application of a harder consistence than an ointment; to be spread, according to the different circumstances of the wound, place, or patient, either upon linen or leather. See *PHARMACY*, n° 854, &c.

*PLASTER*, or *PLASTER*, in building, a composition

Plashing,  
Plaster.

**Plaster.** tion of lime, sometimes with sand, &c. to parget, or cover the nudities of a building. See **PARGETTING** and **STUCCO**.

**PLASTER of Paris**, a preparation of several species of gypsum dug near Mont Maitre, a village in the neighbourhood of Paris; whence the name. See **GYPSUM**; and **CHEMISTRY**, n° 127, 128.

The best sort is hard, white, shining, and marbly; known by the name of *plaster-fine* or *parget of Mount Maitre*. It will neither give fire with steel, nor ferment with aqua fortis; but very freely and readily calcines in the fire into a fine plaster, the use of which in building and casting statues is well known.

The method of representing a face truly in plaster of Paris is this: The person whose figure is designed is laid on his back, with any convenient thing to keep off the hair. Into each nostril is conveyed a conical piece of stiff paper, open at both ends, to allow of respiration. These tubes being anointed with oil, are supported by the hand of an assistant; then the face is lightly oiled over, and the eyes being kept shut, alabaster fresh calcined, and tempered to a thinish consistence with water, is by spoonfuls nimbly thrown all over the face, till it lies near the thickness of an inch. This matter grows sensibly hot, and in about a quarter of an hour hardening into a kind of stony concretion; which being gently taken off, represents, on its concave surface, the minutest part of the original face. In this a head of good clay may be moulded, and therein the eyes are to be opened, and other necessary amendments made. This second face being anointed with oil, a second mould of calcined alabaster is made, consisting of two parts joined lengthwise along the ridge of the nose; and herein may be cast, with the same matter, a face extremely like the original.

If finely powdered alabaster, or plaster of Paris, be put into a basin over a fire, it will, when hot, assume the appearance of a fluid, by rolling in waves, yielding to the touch, steaming, &c. all which properties it again loses on the departure of the heat; and being thrown upon paper, will not at all wet it, but immediately discover itself to be as motionless as before it was set over the fire; whereby it appears, that a heap of such little bodies, as are neither spherical nor otherwise regularly shaped, nor small enough to be below the discernment of the eye, may, without fusion, be made fluid, barely by a sufficiently strong and various agitation of the particles which compose it; and moreover lose its fluidity immediately upon the cessation thereof.

Two or three spoonfuls of burnt alabaster, mixed up thin with water, in a short time coagulate, at the bottom of a vessel full of water, into a hard lump, notwithstanding the water that surrounded it. Artificers observe, that the coagulating property of burnt alabaster will be very much impaired or lost, if the powder be kept too long, especially if in the open air, before it is made use of; and when it hath been once tempered with water, and suffered to grow hard, they cannot, by any burning or powdering of it again, make it serviceable for their purpose as before.

This matter, when wrought into vessels, &c. is still of so loose and spongy a texture, that the air has easy passage through it. Mr Boyle gives an account,

among his experiments with the air-pump, of his preparing a tube of this plaster, closed at one end and open at the other; and on applying the open end to the cement, as is usually done with the receivers, it was found utterly impossible to exhaust all the air out of it; for fresh air from without pressed in as fast as the other, or internal air, was exhausted, though the sides of the tube were of a considerable thickness. A tube of iron was then put on the engine; so that being filled with water, the tube of plaster of Paris was covered with it; and on using the pump, it was immediately seen, that the water passed through into it as easily as the air had done, when that was the ambient fluid. After this, trying it with Venice turpentine instead of water, the thing succeeded very well; and the tube might be perfectly exhausted, and would remain in that state several hours. After this, on pouring some hot oil upon the turpentine, the case was much altered; for the turpentine melting with this, that became a thinner fluid, and in this state capable of passing like water into the pores of the plaster. On taking away the tube after this, it was remarkable that the turpentine, which had pervaded and filled its pores, rendered it transparent, in the manner that water gives transparency to that singular stone called *oculus mundi*. In this manner, the weight of air, under proper management, will be capable of making several sorts of glues penetrate plaster of Paris; and not only this, but baked earth, wood, and all other bodies, porous enough to admit water on this occasion.

**PLASTERING.** See **PARGETTING**.

**PLASTIC**, denotes a thing endowed with a formative power, or a faculty of forming or fashioning a mass of matter after the likeness of a living being; such a virtue, as some of the ancient Epicureans, and perhaps the Peripatetics too, imagined to reside in the earth, or at least to have anciently resided therein, by means whereof, and without any extraordinary intervention of a Creator, it put forth plants, &c. Some of them seem to have been of opinion that animals, and even man himself, were the effects of this plastic power.

**PLASTIC Art**, the art of representing all sorts of figures by the means of moulds. This term is derived from the Greek word *πλαστικη*, which signifies the "art of forming, modelling, or casting in a mould." A mould, in general, is a body that is made hollow for that purpose. The artist makes use of them to form figures in bronze, lead, gold, silver, or any other metal, or fusible substance. The mould is made of clay, stucco, or other composition, and is hollowed into the form of the figure that is to be produced; they then apply the jet, which is a sort of funnel, through which the metal is poured that is to form the figures, and that is called *running the metal into the mould*.

It is in this manner, but with much practice and attention, that the artist forms, 1. Equestrian and pedestrian statues of every kind; 2. Groups; 3. Pedestals; 4. Bas-reliefs; 5. Medallions; 6. Cannons, mortars, and other pieces of artillery; 7. Ornaments of architecture, as capitals, bases, &c.; 8. Various sorts of furniture, as lustres, branches, &c. in every kind of metal: and in the same manner figures are cast in stucco, plaster, or any other fusible matter.

Wax

Plastering,  
Plastic.

Wax being a substance that is very easily put in fusion, plastics makes much use of it. There are impressions which are highly pleasing in coloured wax, of medallions, basso and alto relievos, and of detached figures; which however are somewhat brittle. But this matter has been carried too far: they have not only formed moulds to represent the likeness and the bust of a living person, by applying the plaster to the face itself, and afterward casting melted wax into the mould; but they have also painted that waxen bust with the natural colours of the face, and have then applied glass eyes and natural hair; to which they have joined a stuffed body and limbs, with hands of wax; and have, lastly, dressed their figure in a real habit; and by these means have produced an object the most shocking and detestable that it is possible to conceive. It is not a statue, a bust, a natural resemblance that they form; but a dead body, a lifeless countenance, a mere carcase. The stiff air, the inflexible muscles, the haggard eyes of glass, all contribute to produce an object that is hideous and disgusting to every man of taste. Figures like these offend by affording too exact an imitation of nature. In no one of the polite arts ought imitation ever to approach so near the truth as to be taken for nature herself. Illusion must have its bounds; without which it becomes ridiculous.

There is another invention, far more ingenious and pleasing, which is that wherein M. Lippart, antiquary and artist at Dresden, now excels. He has found the means of resembling, by indefatigable labour, great expence, and infinite taste, that immense number of stones, engraved and in cameau, which are to be seen in the most celebrated cabinets. He has made choice of those that are the most beautiful; and, with a paste of his own invention, he takes from these stones an impression that is surprisingly accurate, and which afterward become as hard as marble: these impressions he calls *passi*. He then gives them a proper colour, and inclues each with a gold rim; and, by ranging them in a judicious order, forms of them an admirable system. They are fixed on pasteboards, which form for many drawers, and are then inclosed in cases, which represent folio volumes, and have titles wrote on their backs; so that these fictitious books may conveniently occupy a place in a library. Nothing can be more ingenious than this invention; and, by this method, persons of moderate fortune are enabled to make a complete collection of all antiquity has left that is excellent of this kind; and these copies are very little inferior to the originals.

There is also another method of taking the impressions of cameaus, medals, and coins, which is as follows: They wash or properly clean the piece whose impression is to be taken, and surround it with a border of wax. They then dissolve isinglass in water, and make a decoction of it, mixing with it some vermilion to give it an agreeable red colour. They pour this paste, when hot, on the stone or medal, to the thickness of about the tenth part of an inch; they then leave it exposed to the sun, in a place free from dust. After a few days this paste becomes hard, and offers to the eye the most admirable and faithful representation of the medal that it is possible to conceive: they are then carefully placed in drawers; and thousands of

these impressions, which comprehend many ages, may be included in a small compass.

The proficients in plastics have likewise invented the art of casting, in a mould, papier maché or dissolved paper, and forming it into figures in imitation of sculpture, of ornaments and decorations for ceilings, furniture, &c. and which they afterwards paint or gild. There are, however, some inconveniencies attending this art; as, for example, the imperfections in the moulds, which render the contours of the figures inelegant, and give them a heavy air: these ornaments, moreover, are not so durable as those of bronze or wood, seeing that in a few years they are preyed on by the worm.

The figures that are given to porcelain, delph ware, &c. belong also to plastics; for they are formed by moulds, as well as by the art of the sculptor and turner; and by all these arts united, are made vases of every kind, figures, groups, and other designs, either for use or ornament.

From this general article the reader is referred to *FOUNDERY, CASTING, GLASS, CHINA Ware, PAPIER-Mache, POTTERY.*

*PLATA*, the name of a very great river of South America, running through the province of Paraguay; whence the whole country is sometimes called *Plata*; though this name is usually bestowed only upon a part of Paraguay. In the latter sense it comprehends all that country bounded on the east and south-east by the Atlantic Ocean; on the south, by Terra Magellanica; on the west, by Tucuman; and on the north, by the provinces of Paraguay Proper, and Parana. The great river La Plata, from which the country has its name, was first discovered, in 1515, by Juan Diaz de Solis; but denominated *La Plata* by Sebastian Gabato, from the great quantity of the precious metals he procured from the adjacent inhabitants, imagining it was the produce of the country, though in fact they brought it from Peru.

The country lies between 32° and 37° of south latitude. The climate is pleasant and healthy. Their winter is in May, June, and July, when the nights are indeed very cold, but the days moderately warm; the frost is neither violent nor lasting, and the snows are very inconsiderable.

The country consists mostly of plains of a vast extent, and exceeding rich soil, producing all sorts of European and American fruits, wheat, maize, cotton, sugar, honey, &c. and abounding with such excellent pastures, that the beasts brought hither from Spain are multiplied to such a degree, that they are all in common, no man claiming any property in them, but every man takes what he hath occasion for. The number of black cattle, especially, is so prodigious, that many thousands of them are killed merely for their hides, every time the ships go for Spain, and their carcases left to be devoured by wild beasts and birds of prey, which are also very numerous. Sometimes, when they cannot vend their hides, they will kill them for their tongues; and those who care not to be at the trouble to fetch them from the plains, may buy them for a trifle. There is a curious account in Lord Anson's voyage of the manner of hunting them on horseback; and of catching and killing them, by throwing a noose on their horns at full gallop, the horses being trained

to the sport. Horses are no less numerous, and in common, like the other cattle; so that a man may have as many as he pleases for the catching; and of those that are already broke, one may buy some of the best, and of the true Spanish breed, for a piece-of-eight per head. Wild-fowl also is in great plenty here; partridges, in particular, are more numerous, and as large and tame as our hens, so that one may kill them with a stick. Their wheat makes the finest and whitest of bread; and, in a word, they seem to want for nothing here, especially the natives, but salt and fuel. The former the Spaniards have brought to them from other parts; and the latter they supply themselves with, by planting vast numbers of almond, peach, and other trees, which require no other trouble than putting the kernels into the ground, and by the next year, we are told, they begin to bear fruit. The return for European commodities is so great here, that it almost exceeds belief; an ordinary two-penny knife fetching a crown; and a gun of the value of 10 or 12 shillings, 20 or 30 crowns, and so of the rest.

The river Plata rises in Peru, and receives a great many others in its course, the chief of which is the Paraguay. The water of it is said to be very clear and sweet, and to petrify wood; and contains such plenty and variety of fish, that the people catch great quantities of them without any other instrument than their hands. It runs mostly to the south and south-east; and is navigable the greater part of its course by the largest vessels, and full of delightful islands. All along its banks are seen the most beautiful birds of all kinds; but it sometimes overflows the adjacent country to a great extent, and is infested by serpents of a prodigious bigness. From its junction with the Paraguay to its mouth is above 200 leagues. We may form some judgment of its largeness by the width of its mouth, which is said to be about 70 leagues. Before it falls into the Paraguay, it is called *Panama*.

*PLATÆÆ*, (anc. geog.), a very strong town of Bœotia, in its situation exposed to the north wind, (Theophrastus); burnt to the ground by Xerxes, (Herodotus, Justinus); mentioned much in the course of the Persian war: Famous for the defeat of Marodonius, the Persian general; and for the most signal victory of the Lacedæmonians and other Greeks under Pausanias the Lacedæmonian, and Ariſtides an Athenian general, (Nepos, Diodorus, Plutarch); in memory of which the Greeks erected a temple to Jupiter Eleutherius, and instituted games which they called *Eleutheria*; and there they show the tombs of those who fell in that battle, (Strabo). It stood at the foot of mount Cithæron, between that and Thebes to the north, on the road to Athens and Megara, and on the confines of Attica and Megaris. Now in ruins.

*PLATALEA*, the *SPONBILL*, in ornithology, a genus belonging to the order of gallæ. The beak is plain, and dilates towards the point into an orbicular form; the feet have three toes, and are half palmed. There are three species, distinguished by their colour. They inhabit the continent of Europe. See Plate CCXLIV. fig. 3.

*PLATANUS*, the *PLANE-TREE*; a genus of the polyandria order, belonging to the monœcia class of plants.

*Species*. 1. The *orientalis*, oriental or eastern plane-tree, rises with a very straight smooth branching stem, to a great height. It has palmated leaves, six or eight inches long and as much broad, divided into five large segments, having the side ones cut into two smaller, green above, and pale underneath; and long pendulous pedunculi, each sustaining several round heads of close-fitting very small flowers; succeeded by numerous downy seeds, collected into round, rough, hard balls. It is a native of Asia and many parts of the east, and grows in great plenty in the Levant. 2. The *occidentalis*, occidental, or western plane-tree, rises with a straight smooth stem, to a great height, branching widely around: it has lobated leaves, seven or eight inches long, and from nine or ten to twelve or fourteen broad, divided into three large lobes; and very small flowers, collected into round heads, succeeded by round, rough, balls of seed.

It is a native of Virginia, and other parts of North America; where it attains an enormous size, and is remarkable for having its stem all of an equal girth for a considerable length: we have an account of some trees being eight or nine yards in circumference, and which when felled afforded 20 loads of wood. The varieties of these two species, are the Spanish or middle plane-tree, having remarkably large leaves of three or five narrower segments; and the maple-leaved plane-tree, having smallest leaves, somewhat lobated into five segments, resembling the maple-tree leaf.

All these elegant trees are of hardy temperature, so as to prosper here in any common soil, and exposure in our open plantations, &c. and are some of the most desirable trees of the deciduous tribe. They were in singular esteem among the ancients of the east, for their extraordinary beauty, and the delightful shade they afforded by their noble foliage. The leaves commonly expand in May, and fall off early in autumn; and the flowers appear in spring, a little before the leaves, being succeeded by seeds, which in fine seasons frequently ripen here in September. These fine trees have singular merit for all ornamental plantations. Their straight growth, regular branching heads, and the lofty stature they attain, together with the extraordinary breadth of their luxuriant leaves, render them extremely desirable furniture to adorn avenues, lawns, parks, and woods; some disposed in ranges, some as single standards, others in clumps, some in groves, &c. They are most excellent for shade; for it is observable, that no tree is better calculated to defend us from the heat in summer, by its noble spreading foliage, and to admit the sun's rays more freely in winter, on account of the distance of its branches, which is always in proportion to the size of the leaves. They may also be employed in the collection of the forest-trees, in woods, to grow up to timber, in which they will also prove advantageous in time. In short, these noble trees claim the esteem of every one concerned in plantations of every kind; but more particularly in extensive works, where they may be so variously disposed as to have a charming effect.

The propagation of these trees is by seed, layers, and cuttings. The seeds frequently ripen in these parts, and are also procured from other countries, and may be obtained of the nurserymen or seedmen. The best season for sowing them is autumn, if they

Platanus  
Plate.

Plate,  
Platform.

can be then possibly procured. Choose a somewhat shady moist soil : and having dug the ground, and raked it fine, form it into four-foot wide beds, and either scatter the seeds evenly on the surface and rake them in, or previously with the back of a rake turn the earth off the surface near half an inch deep into the alleys ; then sow the seed, and directly, with the rake turned the proper way, draw the earth evenly over the seeds, and trim the surface smooth : many of the plants will rise in spring, and probably may not till the spring following. When they are one or two years old, plant them out in nursery rows, two or three feet asunder, and about half that distance in the lines; here to remain till of a proper size for final transplantation. The method of propagation by layers is very commonly practised in the nurseries, in default of seed, and by which they most readily grow; for which purpose, some stout plants for stools must be planted, which in a year after must be headed down near the bottom, that they may throw out many shoots near the ground, convenient for laying ; which, in the autumn after they are produced, lay by for slit-laying ; and by autumn after, they will be well rooted, and form plants two or three feet high, so may be separated, and planted in nursery-rows, like the seedlings. —All the sorts will take tolerably by cutting off the strong young shoots; but the *platanus occidentalis* more freely than the oriental kind. Autumn is the best season : as soon as the leaf falls, choose strong young shoots, and plant them in a moist soil ; many of them will grow, and make tolerable plants by next autumn. It should be remarked, that in order to continue the distinction of the varieties more effectually, they should be propagated either by layers or cuttings; for when raised from seed, those of the respective species generally vary.

**PLATBAND**, in gardening, a border or bed of flowers, along a wall, or the side of a parterre, frequently edged with box, &c.

**PLATEBAND** of a door or window, is used for the lintel, where that is made square, or not much marked.

**PLATE**, a term used by our sportsmen to express the reward given to the best horse at our races.

Spurman's  
Dictionary.

The winning plate is not the work of a few days to the owner of the horse ; but great care and preparation is to be made for it, if there is any great dependence on the success. A month is the least time that can be allowed to draw the horse's body clear, and to refine his wind to that degree of perfection that is attainable by art.

It is first necessary to take an exact view of his body, whether he be low or high in flesh ; and it is also necessary to consider whether he be dull and heavy, or brisk and lively, when abroad. If he appear dull and heavy, and there is reason to suppose it is owing to too hard riding, or, as the jockeys express it, to some grease that has been dissolved in hunting, and has not been removed by scouring, then the proper remedy is half an ounce of diapiente given in a pint of good sack ; this will at once remove the cause, and revive the creature's spirits. After this, for the first week of the month, he is to be fed with oats, bread, and split beans ; giving him sometimes the one and sometimes the other, as he likes best ; and always leaving some

in the locker, that he may feed at leisure when he is left alone. When the groom returns at the feeding-time, whatever is left of this must be removed, and fresh given ; by this means the creature will soon become high spirited, wanton, and full of play. Every day he must be rode out an airing, and every other day it will be proper to give him a little more exercise ; but not so much as to make him sweat too much. The beans and oats in this case are to be put into a bag, and beaten till the hulls are all off, and then winnowed clean ; and the bread, instead of being chipped in the common way, is to have the crust clean cut off. If the horse be in good flesh and spirits when taken up for its month's preparation, the diapiente must be omitted ; and the chief business will be to give him good food, and so much exercise as will keep him in wind, without over-sweating him or tiring his spirits. When he takes larger exercises afterwards, towards the end of the month, it will be proper to have some horses in the place to run against him. This will put him upon his mettle, and the beating them will give him spirits. This, however, is to be cautiously observed, that he has not a bloody heat given him for ten days or a fortnight before the plate is to be run for ; and that the last heat that is given him the day before the race, must be in his clothes : this will make him run with greatly more vigour, when stripped for the race, and feeling the cold wind on every part.

In the second week, the horse should have the same food, and more exercise. In the last fortnight, he must have dried oats, that have been hulled by beating. After this they are to be wetted in a quantity of whites of eggs beaten up, and then laid out in the sun to dry ; and when as dry as before, the horse is to have them. This sort of food is very light of digestion, and very good for the creature's wind. The beans in this time should be given more sparingly, and the bread should be made of three parts wheat and one part beans. If he should become colicive under this course, he must then have some ale and whites of eggs beaten together : this will cool him, and keep his body moist.

In the last week the maff is to be omitted, and barley-water given him in its place, every day, till the day before the race : he should have his fill of hay ; then he must have it given him more sparingly, that he may have time to digest it ; and in the morning of the race day, he must have a toast or two of white bread soaked in sack, and the same just before he is led out to the field. This is an excellent method, because the two extremes of fullness and fasting are at this time to be equally avoided ; the one hurting his wind, and the other occasioning faintness that may make him lose. After he has had his food, the litter is to be shook up, and the stable kept quiet, that he may be disturbed by nothing till he is taken out to run.

**PLATFORM**, in the military art, an elevation of earth, on which cannon is placed, to fire on the enemy ; such are the mounts in the middle of curtains. On the ramparts there is always a platform, where the cannon are mounted. It is made by the heaping up of earth on the rampart, or by an arrangement of madders, rising insensibly, for the cannon to roll on, either in a caemate, or on attack in the outworks. All

Platform,  
Platina.

Platina.

practitioners are agreed, that no shot can be depended on, unless the piece can be placed on a solid platform; for if the platform shakes with the first impulse of the powder, the piece must likewise shake, which will alter its directions and render the shot uncertain.

PLATFORM, in architecture, is a row of beams, which support the timber-work of a roof, and lie on the top of a wall, where the entablature ought to be raised.

This term is also used for a kind of terrace, or broad smooth open walk at the top of a building, from whence a fair prospect may be taken of the adjacent country. Hence an edifice is said to be covered with a platform, when it is flat at top, and has no ridge. Most of the Oriental buildings are thus covered, as were all those of the ancients.

PLATFORM, or *Orlop*, in a man of war, a place on the lower deck, abaft the main mast, between it and the cockpit, and round about the main capitan, where provision is made for the wounded men in time of action.

PLATINA, a metallic substance, analogous to the perfect metals, especially to gold, as many properties are common to both.

Although metals, from their great utility, have been always diligently searched for, yet this has remained undiscovered till lately; which is a very surprising circumstance, and which seems to prove, that platina is not, like the other metals, scattered in different parts of the world, and in all climates. Platina is found in the golden mines of Spanish America, and chiefly in those of Santa Fé near Carthagena, and in the Bailiwick of Choco in Peru.

This metal was probably known to the workers of these mines long before it was brought into Europe: but as its colour is not very fine, and as it is almost intractable, especially by fusion, without addition, they seem to have neglected it, considering it as some refractory mineral or marcasite: some of them, however, had attempted to melt it, and to make toys of it, as tobacco-boxes and other things of that kind; but this must certainly have been by alloying it with other metals, as we shall soon see the impossibility of their doing it otherwise.

Nevertheless, this metal continued to be so neglected, that it was entirely unknown in Europe till Don Antonio Ulloa, a Spanish mathematician, who accompanied the French academicians sent by the king of France to Peru to determine the figure of the earth by measuring a degree of the meridian, first mentioned it in the relation of his voyage, printed at Madrid in the year 1748: but he says little of it, and represents it as an untractable metallic stone, which impeded the extraction of gold from the ore when it was in a large quantity. This account was not very likely to excite the curiosity of chemists concerning a new perfect metal, and a matter so interesting and surprising as they afterwards found it to be.

But before that time, that is, in 1741, an English metallurgist, called *Wood*, who had brought from Jamaica some specimens of it, which he was informed had come from Carthagena, attended more to it, and made some good chemical trials of it. Since that time, several chemists, the chief of which are M. Scheffer,

of the Swedish Academy, and Dr Lewis, of the Royal Society of London, have very particularly examined this singular metal, and have published their experiments. Dr Lewis has in some measure exhausted this matter, in four excellent memoirs communicated to the Royal Society. Platina was, nevertheless, little known in France till the year 1758, when Mr Morin collected, translated into French, and published, an account of all that had hitherto been done upon platina, in a work entitled, *Platina, white gold, an eighth metal*.

This publication excited the curiosity of French chemists, to whom it was a new and interesting object; but the difficulty of obtaining a matter so dear, prevented all of them from being able to satisfy their desire of examining it. Messrs Macquer and Beaumé were the only persons who made experiments upon it, which they have published amongst the Memoirs of the Academy for the year 1751.

About the same time also, Mr Margraaf examined platina, and published a dissertation concerning it.

These are the only chemists who have examined, at least who published their researches concerning this new metal. But although their number be small, yet their experiments are so numerous, made with such accuracy, and in general so consistent with each other, that, by collecting and comparing them, we may acquire a certain and almost as extensive knowledge of platina as of the other metals that have been known from time immemorial. The most general and certain results of the experiments made by the above-mentioned chemists are the following.

*Platina*, a Spanish word, is a diminutive of *plata*, which in that language signifies *silver*. It is therefore called by the Spaniards *little silver*. This name is improper; since it resembles silver only in being indestructible, and very imperfectly in its colour. The name of *white gold*, given to it by some chemists, is more suitable: for we shall see that it resembles gold more than any one metal resembles any other; and hence we shall chiefly compare it to gold.

We do not certainly know the origin and natural history of platina. We can only assert, that all that we see in masses, or worked into forms, is not pure nor in its natural state; for we are certain that it is unfusible, without addition, by the most violent fire of our furnaces, unless perhaps where the fire is blown up by dephlogisticated air, or when precipitated from aqua regia, as we shall afterwards see. All the platina that is found in the cabinets of curious persons consists of small angular grains, the corners of which are a little rounded. It is mixed with a considerable quantity of small black sand, as attractable by magnets as the best iron, but unfusible by acids, unfusible, and untractable. This sand is perfectly similar to that which is found at St Quay in Bretagne. The grains of platina are also frequently interperfed with particles of spar and of quartz, and sometimes with spangles of gold. Messrs Macquer and Beaumé found a pretty large spangle of gold in the platina examined by them. But these heterogeneous matters are quite foreign to platina, and are not combined with it; for it contains nothing extraneous excepting a little gold and mercury, which latter substance it probably receives

Platina.

during the operations for extracting gold from the ores by the means of mercury. These matters may easily be separated from the platina without decomposing it, by washing and by magnets. Some chemists, who know platina only by name, and deny that it is a peculiar metal, have therefore, with great impropriety, advanced, that Mr Margraaf had decomposed it, and had obtained from it gold, iron, and arsenic. The contrary appears from Mr Margraaf's Dissertation. Mr Margraaf only separated the heterogeneous matters which were merely mixed with platina, as other chemists have done; but he is too good a chemist to pretend that he has decomposed it: on the contrary, he does not hesitate to call it a *perfect metal*, which name is also given to it by all who understand metals.

The colour of the grains of platina is metallic, white, livid, not very brilliant, intermediate betwixt the white of silver and the grey of iron. At first view they resemble large filings of iron. They are smooth, and are nearly as hard as iron; they are somewhat ductile; so that some of them may be flattened upon an anvil, while others are bruised into small pieces.

The specific gravity of platina is very great, and nearly equal to that of gold. In water it loses only something betwixt an eighteenth and a nineteenth part of its weight.

The tenacity of the parts of this metal has not been determined, because it cannot be formed into a proper figure to make the experiment. But if this quality is proportionable to the ductility and hardness of metals, we may presume, that as platina is much harder than gold, its tenacity is also greater, if all the ductility of which it seems susceptible could be given to it by art.

Platina is, like pure gold and silver, free from all smell and taste. It is unalterable by the combined action of air and water, and is no more susceptible than the other perfect metals of acquiring rust. Like them also it is indestructible by the most violent and long-continued fire: but the property which peculiarly distinguishes this metal is its unfusibility by the most intense heat.

As fusion is necessary for the application of metals to use, chemists have made their utmost efforts to melt platina. The most violent heat which could be raised in air-furnaces, or by the united action of several large bellows, has been applied repeatedly, and continued a long time, without success. In all these trials, the grains of platina remained unaltered in form and weight, and were only agglutinated to each other, nearly as sand is by exposure to violent heat, but so slightly, that by the smallest effort they were separable. Messrs Macquer and Beaumé exposed platina during five days and five nights to the greatest heat of a glass-house furnace, which trial did only confirm the unfusibility and unalterability of platina by ordinary fires, as it was found to be only a little agglutinated, and its weight to be a little increased; which latter phenomenon has been also observed by Mr Margraaf, and which was undoubtedly owing to the fixed air absorbed by the scales of the imperfect metals mixed with it. Lastly, Messrs Macquer and Beaumé, having exposed platina to the focus of a large burning-

Platina.

glass, melted a little of it in a minute. It first smoked, then emitted sparks, and those parts of it melted well which were exposed to the centre of the focus. These chemists carefully examined the properties of this platina. According to their memoir, the melted parts were distinguishable from the others by a brilliancy like that of silver, and by a rounded, shining, polished surface. They were easily flattened upon an anvil, and formed into very thin plates without cracking or splitting; so that these grains seemed to be much more malleable than platina in its natural state. These metals by repeated strokes of the hammer became hard and brittle, as all other metals do, particularly gold and silver; and by annealing, their malleability was restored, as it is also to other metals by the same means. After experiments so certain and well authenticated, we cannot doubt that platina is truly a metal, and even a third metal, as perfect in its kind as gold and silver are in theirs. This proposition will be further confirmed by the other properties of platina.

Platina resists as perfectly as gold the action of the vitriolic, marine, or nitrous acids; in a word, of any pure acid, in whatever manner applied. These acids, concentrated or diluted, may be boiled any length of time upon platina without dissolving an atom of it: but a mixture of nitrous and marine acids, aqua regia, the solvent of gold, is also the solvent of platina. Messrs Macquer and Beaumé have observed, that an aqua regia composed of equal parts of the two acids dissolves most of this metal. But, however the aqua regia is made, more of it is required to dissolve platina than gold. These chemists employed a pound of aqua regia to dissolve an ounce of platina. All the acid of this quantity of aqua regia was not indeed employed to dissolve the platina, because much of it was dissipated in vapours during the operation, from the long time employed in the solution; and therefore, if the operation had been performed in close vessels, and by distillation and cohobation, as Dr Lewis did, a less quantity of aqua regia would have been sufficient: but this is a matter of small importance.

Aqua regia requires to be assisted by the heat of a sand-bath, and also a considerable time, to dissolve platina well. Although the colour of this metal is white, its solution is very yellow, even deeper than that of gold. When a small quantity of platina only is dissolved in aqua regia, or when a saturated solution is much diluted, a beautiful yellow colour is produced, undistinguishable from that of a solution of gold: but while the aqua regia becomes more and more saturated with platina, its colour becomes more and more intense, and at last red; but this apparent redness evidently proceeds from nothing but the intensity of the yellow colour; for this saturated solution is rendered yellow by dilution with water. In this circumstance it is similar to tincture of saffron.

The solution of platina in aqua regia is acid and corrosive, and from it a neutral crystallizable salt may be obtained. When the acids employed are concentrated, and when the solution is nearly saturated, a confused crystallization is formed at the bottom of the vessels, which may be found to be a heap of very small, yellow, transparent crystals. These crystals of platina may be obtained much larger and more beautiful by evaporating the solution of platina with a very slow

Platina. flow fire, and by cooling it very slowly. The solution of platina tinges the skin and other animal matters with a blackish brown colour in certain circumstances, (in which respect it resembles the solutions of gold, silver, and of mercury); and ether mixed with this solution by agitation quickly separates from it, and becomes tinged with a fine yellow colour, precisely as it does when it is treated in the same manner with a solution of gold. This experiment shews, that ether, and probably other attenuated oily matters, take platina, as they do gold, for aqua regia; and hence we may perceive another instance of the conformity of those two metals. But as ether does not acquire nearly so intense a colour as the solution of platina, we may infer that it only receives a small quantity of this metal. Besides, the platina soon separates spontaneously from the ether.

Platina may be precipitated from its solvent by fixed and volatile alkalis: and these precipitates are all of a yellow brick-colour, when only so much alkali is employed as is necessary to saturate the acid of the solution; but are of a paler colour when a superabundant quantity of alkali is employed, or when they are digested in alkali. Mr Margraaf mentions a very singular fact concerning the precipitation of platina by alkalis; namely, that although vegetable fixed alkali, and even volatile alkali, precipitated this metal from aqua regia; yet the mineral alkali, though in other instances equal in power of union to the former alkali, and superior to the latter, produced no precipitation, even when so much of it was added as to saturate the acid, nor even disturbed the transparency of the liquor. The above colours of precipitates of platina, according to Mr Macquer, proceed from a large quantity of saline matters which precipitate along with them, and which strongly adhere to them, and not from any calcination of this metal, or loss of its phlogiston. The proof of this is, that if the crystals or precipitates of platina be exposed to strong heat, the saline matters which adhere to them are expelled, the colour occasioned by them is lost, and the platina recovers, without any addition, its ordinary metallic state.—However, there is no reason here to suppose an adhesion of saline matter to the precipitate, which never can be proved, and besides is very improbable, since we know not any substance which has so great an attraction for salts as water. Under the article PHLOGISTON, it is explained how the calx of a metal may be revived merely by heat, without any apparent addition of phlogistic matter.

All the above-mentioned phenomena exhibited by platina treated with acids and alkalis are similar to those which gold exhibits in similar circumstances: but platina has also in this respect some peculiar properties, by which it differs from gold. 1. The solution of platina acquires a deeper colour than that of gold. 2. The precipitate of platina made by volatile alkali does not fulminate as that of gold does. 3. Tin does not produce from the solution of platina a purple precipitate, capable of tinging glass, as it does from a solution of gold.

Neither nitre, which quickly and effectually calcines all imperfect metals; nor corrosive sublimate, the acid of which, being very much concentrated, acts upon almost all metals; nor any other neutral salt, could

occasion the smallest alteration upon platina or upon gold.

This singular metal resists, as well as gold does, the action of sulphur, which so powerfully dissolves other metals. From Dr Lewis's experiments we find, that liver of sulphur is capable of dissolving platina, as it does also gold, by fusion. Mr Margraaf's experiments leave this matter uncertain: but if, as we have reason to believe, liver of sulphur does dissolve platina, this is another instance of the conformity of this metal with gold.

Almost all metallic substances are capable of separating platina from aqua regia, as they also separate gold. Platina precipitated by these substances has its metallic appearance. In this respect it conforms with a general rule, that metals precipitated by other metals have their metallic appearance.

Mr Margraaf relates, in his memoir, a great number of experiments which he made to discover the effects of mixing a solution of platina with other metallic solutions, and also of digesting pure platina with these solutions and other saline substances. These experiments furnished many curious and interesting facts; but as several of them do not seem to be consistent with the essential and ascertained properties of platina, nor even with similar experiments made by other chemists, there seems reason to believe that these singularities observed by this able chemist proceeded from some extraneous matters with which his platina was alloyed. From most of these experiments, as, for instance, from the yellow flowers obtained by subliming platina with sal ammoniac, and from the blue precipitate formed by mixing his solution of platina with a lixivium of Prussian blue, we may conclude, that iron was the metal with which his platina was alloyed, as he himself says.

Platina, like gold, is capable of being alloyed with all metals, and in these alloys exhibits interesting phenomena. Dr Lewis has examined these alloys more carefully and fully than any other person. The following is an epitome of Dr Lewis's observations on the subject.

Platina, although very unfusible when alone, may however be fused along with other metals with which it is capable of combining. Equal parts of gold and platina may be melted in a violent fire, and the alloy which is formed may be easily poured into an ingot mould. It is whitish, hard, and may be broken by a violent blow. Nevertheless, when it has been well annealed, it is capable of considerable extension under the hammer. One part of platina and four parts of gold may be melted and alloyed with a much less fire than is requisite in the preceding experiment. This alloy is so ductile, that it may be extended into very thin plates, without being broken, or even split at the edges. Dr Lewis observed a remarkable circumstance concerning this alloy, namely, that the platina, which was  $\frac{1}{4}$  of the whole mass, rendered the gold no paler than guineas are, which contain only  $\frac{1}{15}$  of silver.

Silver and platina may be melted and alloyed together in equal parts with a very violent fire. The alloy which is formed is much harder and darker-coloured than silver, and of a large grain, although it preserves some ductility. These qualities are less sensible when one part of platina is added to seven parts of the silver;

but this alloy is still coarser-grained and less white than silver. This coarseness of grain shows an imperfect union: and indeed silver and platina do not seem to unite very intimately; for Dr Lewis observes, that when the alloy of these two metals was left after fusion in the crucible, a considerable part of the platina was separated and sunk to the bottom. The platina did not appear to communicate any good quality to the silver, excepting a greater hardness.

Copper seems to be most improved by being alloyed with platina. When indeed a large proportion of platina is added to copper, as equal parts or two-thirds, the alloy is hard, brittle, and coarse; but when a less quantity of platina is added, as from  $\frac{1}{2}$  to  $\frac{1}{3}$ , or even less, a golden-coloured copper is produced, very malleable, harder, susceptible of a finer polish, smoother-grained, and much less subject to calcination and rust, than pure copper.

Dr Lewis was not able to fuse forged iron with platina; which is not surprising, when we consider the refractory qualities of these two metals: but he alloyed platina with cast-iron, by throwing one part of platina to four parts or more of the iron when it was just beginning to flow. This alloy was much harder, and much less subject to rust, than pure iron. It was susceptible of a very fine polish.

Platina may be melted with tin in all proportions, from equal parts of the two metals to 24 parts of tin. This alloy was observed to be so much harder, more brittle, more dark-coloured, and coarser, as the proportion of the platina was larger. No advantage seemed to be acquirable by this alloy. Lead also may be alloyed in different proportions with platina, nearly as tin may; with this difference, that a much greater fire is necessary for the formation of this latter alloy, particularly when the quantity of platina is great. The metal resulting from it has a dark colour, somewhat approaching to a purple or violet, or it easily acquires these colours when exposed to the air. When the two metals fused together are left in a crucible to cool, a considerable part of the platina separates and falls to the bottom, in the same manner as it does from the alloy of silver.

From Dr Lewis's experiments, platina appears to be capable of amalgamating with mercury, but difficultly, and by a very long trituration with water, as, for instance, during a week.

If mercury be triturated with an alloy of gold and platina, it seizes the gold, and does not touch the platina. Dr Lewis proposes this amalgamation as a method of separating these two metals; and it is that which is employed in the ores of Peru, in which gold and platina are mixed together: but we do not yet know whether this separation be perfectly complete.

Platina may be alloyed with bismuth nearly as with lead, and in a similar manner separates from the bismuth after fusion. It gives to bismuth also, as it does to lead, the property of acquiring, by exposure to air, violet, purple, or blue colours. This alloy is always very brittle.

Of all metallic matters, zinc may be most easily alloyed with platina, and most effectually dissolved by fusion. Dr Lewis observed, that these alloys did not appear very different from pure zinc; but that when the proportion of platina is considerable, their grain is

closer, their colour less clear and more bluish, than of zinc. They do not tarnish nor change colours by exposure to air. Lastly, they are harder than zinc, and have not the semi-malleability of this semi-metal.

With regulus of antimony platina formed a darker and harder compound than the pure regulus.

Dr Lewis has combined platina at the same time with two metallic matters, such as with brass composed of copper and zinc, and with bronze composed of copper and tin. The most singular phenomenon of this latter alloy was, that the copper and tin acting conjointly upon the platina were capable of dissolving more of it than they both could do separately. This alloy was hard, and capable of receiving a fine polish, but is subject to tarnish; which seems to happen to all the alloys of tin or of lead with platina.

Equal parts of platina and brass formed a compound very hard and very brittle, capable of receiving a very fine polish, and not subject to tarnish. It is possible, therefore, that it might be employed for speculums of telescopes, and would be much preferable to those now used; all which have the great disadvantage of tarnishing by exposure to air, and even very quickly.

Dr Lewis does not mention the effects of alloying platina with arsenic; but Mr Scheffer affirms, that if only a twentieth part of arsenic be added to platina when red-hot in a crucible, these two substances will be perfectly fused, and will form a brittle gray mass. This remarkable experiment requires confirmation; for Mr Margraaf, having also treated these two matters together, did not perceive any such action of arsenic upon platina. From one of his experiments we find, that having exposed to a violent fire during an hour a mixture of an ounce of platina with a fusible glass, composed of eight ounces of minium, two ounces of flints, and one ounce of white arsenic, he obtained a regulus of platina, well united and fused, which weighed an ounce and 32 grains, the surface of which was smooth, white and shining, and the internal parts grey, but which nevertheless appeared sufficiently white when it was filed.

The cupellation of platina was one of the most important experiments to be made; because if this operation succeeded perfectly, we might thereby obtain compact and malleable masses of pure platina, in the same state as a metal which had been well fused, and of which all sorts of utensils might be made, if not by casting it, at least by forging. All the chemists who have examined this metal, and particularly Dr Lewis, have used their utmost endeavours to cupel it well. But although they have used every expedient to apply the strongest heat, they have not perfectly succeeded. The scorification proceeds well at the beginning of the operation, as when gold and silver are cupelled: but the cupellation afterwards becomes more and more difficult; because, as the quantity of lead diminishes, the matter becomes less and less fusible, and at last ceases to be fluid, notwithstanding the most violent heat; and also because, when the quantity of platina is greater than that of the lead, this latter metal is protected, and is not converted into litharge. Hence the regulus obtained is always dark-coloured, rough, adhering to the cupel, brittle, and weighing more than the platina originally employed, from the lead which remains united with it. Mess. Macquer and Beaumé appear

Platina.

appear nevertheless to have carried this experiment further than any other chemists, as they kept the matter exposed to a violent fire during a longer time, that is, about 50 hours successively: therefore, although their platina was tarnished and rough on its surface, it was internally white and shining, easily separable from the cupel, and a little diminished in weight; a certain proof that no lead remained in it. This platina was also ductile, and capable of extension under the hammer.

Cupellation is therefore a certain method of applying platina to use, and of forming it into utensils.

Some further and very important experiments have been made on this singular metallic substance by Mess. Buffon, De Lisle, and Morveau. M. Buffon separated, by means of a magnet, six parts out of seven of a parcel of platina. He distinguished two different matters in platina; of which one is black, friable, and attractable by magnets; and the other consists of larger grains, is of a livid white or yellowish colour, much less attractable, and is extensible. Between these two different matters are many intermediate particles, some partaking more of the former, and some of the latter. He thinks that the black matter is chiefly iron; and he says, that he has observed a similar black powder in many ores of iron. M. Morveau found, that a Prussian blue could be obtained from the black part of the platina, by pouring upon it spirit of nitre, and afterwards adding to the solution diluted some phlogisticated alkali; and that the particles of platina which could not be attracted by magnets, did not by this method shew any sign of their containing iron.

But the most important discovery that has been made concerning platina, is a method of melting it, by which it becomes a perfect metal, malleable, and denser than gold. M. De Lisle effected this, by dissolving crude platina in aqua regia, precipitating it from the acid menstruum by sal ammoniac, and by fusing this precipitate, without addition, in a double crucible, exposed to the intense heat of a forge-fire excited by double bellows. M. Morveau has repeated this experiment. From 72 grains of platina he obtained a regulus, which weighed 50½ grains, and seemed to have undergone a very imperfect fusion; for it did not adhere to the crucible, nor take its form, but seemed to be the platina merely revived. Its specific gravity also was found to be to that of water no more than as 10.045 to 1. But it was found to be nearly as malleable as silver; and when it had been sufficiently hammered, its specific gravity was found to be to water as 20.170 to 1. M. Morveau found that he could melt the precipitate with several fluxes; such as, a mixture of white glass, borax, and charcoal, and a mixture of white glass and neutral arsenical salt; and that the regulus thus obtained was more completely fused, but was not malleable, and was capable of being attracted by magnets; whereas the regulus obtained without addition did not give this mark of containing iron. He further found, that by means of the above-mentioned flux of white glass, borax, and charcoal, he could melt crude platina, and could alloy together platina and steel in various proportions.

The sciences, commerce, and arts, must receive great advantages from the application of a new perfect

metal to useful purposes, which to the fixity and indestructibility of gold, unites a hardness and solidity almost equal to those of iron; which is unalterable by the action of water and air; is not subject to rust; and resists, as well as glass or earthen vessels, all salts, even aquafortis and other pure acids. It is to be regretted, that, although large quantities of it are found in America, it is so exceedingly rare here.

The cause of this great scarcity of platina is, that the Spanish ministry have prohibited the sale of it, or the extraction of it from the mines. These prohibitions were certainly from good motives and wise intentions: for this metal was no sooner known, than it was employed for the adulteration of gold; for which purpose it is very fit, as it sustains all the ordinary trials of gold, has the same specific gravity, and renders gold much less pale than silver. The use of a metal with which frauds so prejudicial might be committed with impunity, was necessarily interdicted; but since the best chemists of Europe have examined platina, they have published certain and easy methods by which the smallest quantity of platina mixed with gold may be discovered, and by which these metals may be separated, in whatever proportion they may happen to be united. As a particular detail of these methods would exceed our bounds, we shall here relate only one of the most convenient and least troublesome. It is founded on a property which gold has, and not platina, of being capable of precipitation from aqua regia by martial vitriol; and upon a property which platina has, and not gold, of being capable of precipitation from aqua regia by sal ammoniac. When therefore we would discover if gold be alloyed with platina, let it be dissolved in aqua regia; and to this solution, which will contain both metals, let some sal ammoniac, dissolved in water, be added; upon which the platina will be precipitated in form of a brick-coloured sediment. If, on the other side, we would know if platina contained any gold, let this platina be dissolved in aqua regia, and to the solution add a solution of martial vitriol in water; upon which the liquor will become turbid, and the gold will form a precipitate which may be easily separated by decanting and filtrating the liquor.

We may then affirm, that the reasons which induced the Spanish ministry to interdict the use of platina no longer subsist; and we hope, that, when they are once convinced of this, society shall no longer be deprived of a substance which may be so advantageous to them, and which may be a new source of wealth to the crown of Spain, the sole proprietor of this precious treasure.

PLATO, a most illustrious philosopher of antiquity, was born at Athens about 430 B. C. He was a person of very great quality; being defended by his father's side from royal ancestors, and by his mother's side from Solon. He was educated in a manner suitable to his rank: he learned grammar, mathematics, music, and painting. In his first years he addicted himself much to poetry; he wrote odes and dithyrambs first, and afterwards epic poetry; which last, finding much inferior to Homer's, he burned. Then he betook himself to writing tragedies, and had prepared one to contend for the prize at the Olympic theatre: but the day before it should have been presented, he happened to hear Socrates, and was so charmed

Platina,  
Plato.

charmed with his way of discoursing, that he not only forbore the contest at that time, but neglected poetry ever after, and even destroyed all his poems.

He was about the 20th year of his age, when he became a follower of Socrates, and began to study philosophy. This great master, soon observing in Plato a greater genius than common, was mightily taken with him: he advised him to read Homer often; and from thence Plato brought himself to conceive and speak of things in a lofty, copious, and striking manner. Plato was equally attached to Socrates: he raised a considerable sum of money to procure his release, after he was imprisoned upon the accusations of his enemies; and when this failed, had the boldness to harangue in defence of him to the people, which he began to do so pathetically, that the magistrates, fearing a tumult, caused him to be silenced. Eight years he lived with Socrates; in which time he committed, as did Xenophon and his other disciples, the substance of his master's discourses to writing. Of this he composed dialogues; but with so great additions of his own, that Socrates, hearing him recite his *Lysis*, cried out, "O Hercules! how many things does this young man feign of me!" for, as Laertius adds, many of those things which Plato writ, Socrates never spoke.

The philosophers who were at Athens were so alarmed at the death of Socrates, that most of them fled the city to avoid the injustice and cruelty of the government. Plato, whose grief upon this occasion is said by Plutarch to have been excessive, retired to Megara; where he was friendly entertained by Euclid, who had been one of Socrates's first scholars, till the storm was over. Afterwards he determined to travel in pursuit of knowledge; and from Megara he went to Italy, where he conferred with Eurytus, Philolaus, and Archytas. These were the most celebrated of the followers of Pythagoras, whose doctrine was then become famous in Greece; and from these the Pythagoreans have affirmed that he had all his natural philosophy. He dived into the most profound and mysterious secrets of the Pythagoric doctrines; and perceiving other knowledge to be connected with them, he went to Cyrene, where he learned geometry of Theodorus the mathematician. From thence he passed into Egypt, to acquaint himself with the theology of their priests, to study more nicely the proportions of geometry, and to instruct himself in astronomical observations; and having taken a full survey of all the country, he settled for some time in the province of Sais, learning of the wise men there, what they held concerning the universe, whether it had a beginning, whether it moved wholly or in part, &c.; and Pausanias affirms, that he learned from these the immortality, and also the transmigration, of souls. Some of the fathers will have it, that he had communication with the books of Moses, and that he studied under one Sechnuphis, a learned man of Heliopolis, who was a Jew: but there is nothing that can be called evidence for these assertions. St Austin once believed that Plato had some conference with Jeremiah; but afterwards discovered, that that prophet must have been dead at least 60 years before Plato's voyage to Egypt.

Plato's curiosity was not yet satisfied. He travelled into Persia, to consult the magi about the religion of

that country: and he designed to have penetrated even to the Indies, and to have learned of the Brachmans their manners and customs; but the wars in Asia hindered him.

Being returned to Athens from his travels, he applied to the teaching philosophy, which at that time was the most honourable profession there. He set up his school in the academy, a place of exercise in the suburbs of the city, beset with woods; and this, not being a very healthy situation, brought a quartan ague on him, which lasted 18 months. The physicians advised him to remove to the Lyceum; but he refused, and answered, "I would not live on the top of Athos, to linger away life!" and it was from the academy, that his sect took the name of *Academici*. Yet settled as he was, he afterwards made several voyages abroad: one particularly to Sicily, in order to view the fiery ebullitions of Mount *Ætna*. Dionysius the tyrant reigned then at Syracuse; a very bad man; for, as Cicero relates, after he had robbed a temple at Locris, and was returning by sea to Sicily with a prosperous gale, he said to his companions, "You see, my friends, how the gods favour sacrilege." Plato went to see him; but instead of flattering him like a courtier, reproved him for the disorders of his court and the injustice of his government. The tyrant, not used to disagreeable truths, grew enraged at Plato; and would have put him to death, if Dion and Aristomenes, formerly his scholars, and then favourites of that prince, had not powerfully interceded in his behalf. Dionysius was content to deliver him into the hands of an envoy of the Lacedæmonians, who were then at war with the Athenians; and this envoy, touching upon the coast of *Ægina*, sold him for a slave to a merchant of Cyrene, who as soon as he had bought him sent him away to Athens. Some time after, he made a second voyage into Sicily in the reign of Dionysius the Younger; who sent Dion, his minister and favourite, to invite him to court, that he might learn from him the art of governing his people well. Plato accepted the invitation, and went; but the intimacy between Dion and Plato raising jealousy in the tyrant, the former was disgraced, and the latter sent back to Athens.

His fame was now spread far and wide; and several states, among which were the Arcadians and Thebans, sent ambassadors with earnest requests that he would come over, not only to instruct the young men in philosophy, but also to prescribe them laws of government. The Cyrenians, Syracusians, Cretans, and Eleans, sent also to him: he did not go to any of them, but gave laws and rules of governing to all. He lived single, yet soberly and chastely. He was a man of great virtues, and exceedingly affable; of which we need no greater proof, than his civil manner of conversing with the philosophers of his own times, when pride and envy were at their height. His behaviour to Diogenes is always mentioned in his history. The Cynic was vastly offended, it seems, at the politeness and fine taste of Plato, and used to catch all opportunities of snarling at him. He dined one day at his table with other company, and, trampling upon the tapestry with his dirty feet, uttered this brutish sarcasm, "I trample upon the pride of Plato;" to which Plato wisely reparted, "With greater pride."

The same of Plato drew disciples to him from all parts:

Plato.

parts: among whom were Speusippus, an Athenian, his sister's son, whom he appointed his successor in the academy; the great Aristotle; two ladies, Lalthenia a Mantinian, and Axiothia a Philiatian, who were habituated as men, and thereby gave occasion to injurious suspicions of Plato; Hyperides, Demosthenes, and Isocrates, with the last of whom Plato was very intimate. In the mean time, as his great reputation gained him on the one hand many disciples and admirers, so on the other it raised him some emulators, especially among his fellow-disciples, the followers of Socrates. Xenophon and he were particularly disaffected towards each other; and their emulation appears in nothing more than in their having written upon the same subjects. They both writ a Symposium: they both writ about Socrates: they both writ upon government; for the Commonwealth of Plato, and the Institution of Cyrus, are works of the same nature; the latter being pronounced by Cicero, as much a work of invention as the former.

This extraordinary man, being arrived at 81 years of age, died a very easy and peaceable death, in the midst of an entertainment, according to some; but, according to Cicero, as he was writing. Both the life and death of this philosopher were calm and undisturbed; and indeed he was finely composed for happiness. Besides the advantages of a noble birth, he had a large and comprehensive understanding, a vast fund of wit and good taste, great evenness and sweetness of temper, all cultivated and refined by education and travel; so that it is no wonder if he was honoured by his countrymen, esteemed by strangers, and adored by his scholars. The ancients thought more highly of Plato than of all their philosophers: they always called him the *Divine Plato*, and they seemed resolved that his descent should be more than human. "There are (says Apuleius) who assert Plato to have been sprung from a more sublime conception; and that his mother Perictione, who was a very beautiful woman, was impregnated by Apollo in the shape of a spectre." Plutarch, Suidas, and others, affirm this to have been the common report at Athens. When he was an infant, his father Aristo went to Hymettus, with his wife and child, to sacrifice to the muses; and while they were busied in the divine rites, a swarm of bees came and distilled their honey upon his lips. This, says Tully, was considered as a preface of his future eloquence. Apuleius relates, that Socrates, the night before Plato was recommended to him, dreamed that a young swan fled from Cupid's altar in the academy, and settled in his lap, thence soared to heaven, and delighted the gods with its music; and when Aristo the next day presented Plato to him, "Friends (says Socrates), this is the swan of Cupid's academy." The Greeks loved fables: they show however in the present case, what exceeding respect was paid to the memory of Plato. Tully perfectly adored him; tells us, how he was justly called by Panætzus the *divine*, the *most wise*, the *most sacred*, the *Homer of philosophers*; entitled him to Atticus, *Deus ille nostris*; thinks, that if Jupiter had spoken Greek, he would have spoken in Plato's language; and made him so implicitly his guide in wisdom and philosophy, as to declare, that he had rather err with Plato than be right with any one else. But, panegyric aside, Plato was certainly a very wonderful man, of a large

and comprehensive mind, an imagination infinitely fertile, and of a most flowing and copious eloquence. Nevertheless, the strength and heat of fancy prevailing in his composition over judgment, he was too apt to soar beyond the limits of earthly things, to range in the imaginary regions of general and abstracted ideas; and on which account, though there is always a greatness and sublimity in his manner, he did not philosophise so much according to truth and nature as Aristotle, though Cicero did not scruple to give him the preference.

The writings of Plato are all in the way of dialogue; where he seems to deliver nothing for himself, but every thing as the sentiments and opinions of others, of Socrates chiefly, of Timæus, &c. He does not mention himself any where, except once in his *Phædo*, and another time in his *Apology* for Socrates. His style, as Aristotle observed, is betwixt prose and verse: on which account, some have not scrupled to rank him with the poets. There is a better reason for so doing, than the elevation and grandeur of his style: his matter is oftentimes the offspring of imagination, instead of doctrines or truths deduced from nature. The first edition of Plato's works in Greek was put out by Aldus at Venice in 1513: but a Latin version of him by Marcellus Ficinus had been printed there in 1491. They were re-printed together at Lyons in 1588, and at Frankfurt in 1602. The famous printer Henry Stephens, in 1578, gave a most beautiful and correct edition of Plato's works at Paris, with a new Latin version by Serranus, in three volumes folio; and this deservedly passes for the best edition of Plato: yet Serranus's version is very exceptionable, and in many respects, if not in all, inferior to that of Ficinus.

PLATONIC, something that relates to Plato, his school-philosophy, opinions, or the like. Thus, platonic love denotes a pure spiritual affection, for which Plato was a great advocate, subsisting between the different sexes, abstracted from all carnal appetites, and regarding no other object but the mind and its beauties: or it is even a sincere disinterested friendship subsisting between persons of the same sex, abstracted from any selfish views, and regarding no other object than the person, if any such love or friendship has aught of a foundation in nature.

PLATONIC Year, or the *Great Year*, is a period of time determined by the revolution of the equinoxes, or the space wherein the stars and constellations return to their former places, in respect of the equinoxes. The platonic year, according to Tycho Brahe, is 25816, according to Ricciolus 25920, and according to Cassini 24800 years.

This period once accomplished, it was an opinion among the ancients, that the world was to begin anew, and the same series of things to turn over again.

PLATONISM, the doctrine and sentiments of Plato and his followers, with regard to philosophy, &c.

In physics, Plato followed Heraclitus; in ethics and politics, Socrates; and in metaphysics he followed Pythagoras. His disciples were called *academics*. See the articles *ACADEMIC*, &c.

The Platonic philosophy is thought very consistent with the Mosaic; and a great many of the primitive fathers follow the opinions of that philosopher, as being favourable to Christianity. Justin is of opinion, that

Plato

Platonism.

Plautus,  
Plea.

Plea.

that Plato could not learn many things which he has said in his works, from mere natural reason; but thinks he might have learned them from the books of Moses, which he might have read when in Egypt.

PLAUTUS (Marcus Accius), a comic writer of ancient Rome, born at Umbria, a province of Italy. His proper name was *Marcus Accius*, and he is supposed to have acquired the surname of *Plautus* from having iplay feet. His parentage appears to have been mean; so that some have thought he was the son of a slave. Aulus Gellius says that Plautus was distinguished for his poetry on the theatre, and Cato for his eloquence in the Forum, at the same time; and observes elsewhere from Varro, that he was so well paid for his plays, as to double his stock in trading, in which he lost all he gained by the muses. He is said to have been reduced to work at a mill for his subsistence; but Varro adds, that his wit was his best support, as he composed three of his plays during this drudgery. He died in the first year of the elder Cato's censorship, about the year of Rome 569, and 184 B. C. We have 20 of his plays extant, though not all of them entire. Five of them comedies have been elegantly translated into English by Mr B. Thornton, and published in 2 vols 8vo. 1767.

PLEA, in law, is what either party alleges for himself in court, in a cause there depending; and in a more restrained sense, it is the defendant's answer to the plaintiff's declaration.

Pleas are usually divided into those of the crown, and common pleas. Pleas of the crown are all suits in the king's name, or in the name of the attorney-general in behalf of the king, for offences committed against his crown and dignity, and against his peace; as treason, murder, felony, &c. See ARRAIGNMENT.

Common pleas are such suits as are carried on between common persons in civil cases. These pleas are of two sorts; *dilatory* pleas, and pleas to the *action*. Dilatory pleas are such as tend merely to delay or put off the suit, by questioning the propriety of the remedy, rather than by denying the injury: pleas to the action are such as dispute the very cause of suit.

I. *Dilatory* pleas are, 1. To the jurisdiction of the court: alleging, that it ought not to hold plea of this injury, it arising in Wales or beyond sea; or because the land in question is of ancient demesne, and ought only to be demanded in the lord's court, &c. 2. To the disability of the plaintiff, by reason whereof he is incapable to commence or continue the suit; as, that he is an alien enemy, outlawed, excommunicated, attainted of treason or felony, under a præmunire, not *in rerum natura* (being only a fictitious person), an infant, a feme-covert, or a monk professed. 3. In abatement: which abatement is either of the writ, or the count, for some defect in one of them; as by misnaming the defendant, which is called *misnomer*; giving him a wrong addition, as esquire instead of knight; or other want of form in any material respect. Or, it may be that the plaintiff is dead; for the death of either party is at once an abatement of the suit.

These pleas to the jurisdiction, to the disability, or in abatement, were formerly very often used as mere dilatory pleas, without any foundation in truth, and calculated only for delay; but now by stat. 4 & 5 Ann. c. 16. no dilatory plea is to be admitted without affi-

davit made of the truth thereof, or some probable matter shown to the court to induce them to believe it true. And with respect to the pleas themselves, it is a rule, that no exception shall be admitted against a declaration or writ, unless the defendant will in the same plea give the plaintiff a better; that is, shew him how it might be amended, that there may not be two objections upon the same account.

All pleas to the jurisdiction conclude to the cognizance of the court; praying "judgment whether the court will have farther cognizance of the suit." Pleas to the disability conclude to the person; by praying "judgment, if the said A the plaintiff ought to be answered:" And pleas in abatement (when the suit is by original) conclude to the writ or declaration; by praying "judgment of the writ, or declaration, and that the same may be quashed," *castetur*, made void, or abated: but if the action be by bill, the plea must pray "judgment of the bill," and not of the declaration; the bill being here the original, and the declaration only a copy of the bill.

When these dilatory pleas are allowed, the cause is either dismissed from that jurisdiction, or the plaintiff is stayed till his disability be removed; or he is obliged to sue out a new writ, by leave obtained from the court, or to amend and new-frame his declaration. But when, on the other hand, they are overruled as frivolous, the defendant has judgment of *respondat ouster*, or to answer over in some better manner. It is then incumbent on him to plead.

2. A plea to the *action*; that is, to answer to the merits of the complaint. This is done by confessing or denying it.

A confession of the whole complaint is not very usual, for then the defendant would probably end the matter sooner; or not plead at all, but suffer judgment to go by default. Yet sometimes, after tender and refusal of a debt, if the creditor harasses his debtor with an action, it then becomes necessary for the defendant to acknowledge the debt, and plead the tender; adding that he has always been ready, *tout temps prêt*, and still is ready, *uncore prêt*, to discharge it: for a tender by the debtor and refusal by the creditor will in all cases discharge the costs, but not the debt itself; though in some particular cases the creditor will totally lose his money. But frequently the defendant confesses one part of the complaint (by a *cognovit actionem* in respect thereof), and traverses or denies the rest; in order to avoid the expence of carrying that part to a formal trial, which he has no ground to litigate. A species of this sort of confession is the *payment of money into court*: which is for the most part necessary upon pleading a tender, and is itself a kind of tender to the plaintiff; by paying into the hands of the proper officer of the court as much as the defendant acknowledges to be due, together with the costs hitherto incurred, in order to prevent the expence of any farther proceedings. This may be done upon what is called a *motion*; which is an occasional application to the court by the parties or their counsel, in order to obtain some rule or order of court, which becomes necessary in the progress of a cause; and it is usually grounded upon an *affidavit*, (the perfect tense of the verb *affido*), being a voluntary oath before some judge or officer of the court, to evince

Blackf.  
Comment.

vince the truth of certain facts, upon which the motion is grounded: though no such affidavit is necessary for payment of money into court. If, after the money is paid in, the plaintiff proceeds in his suit, it is at his own peril: for if he does not prove more due than is so paid into court, he shall be nonsuited and pay the defendant's costs; but he shall still have the money so paid in, for that the defendant has acknowledged to be his due. To this head may also be referred the practice of what is called a *set off*: whereby the defendant acknowledges the justice of the plaintiff's demand on the one hand; but on the other, sets up a demand of his own, to counterbalance that of the plaintiff, either in the whole or in part: as, if the plaintiff sues for ten pounds due on a note of hand, the defendant may set off nine pounds due to himself for merchandize sold to the plaintiff; and, in case he pleads such set-off, must pay the remaining balance into court.

Pleas that totally deny the cause of complaint are either the general issue, or a special plea in bar.

1. The *general issue*, or general plea, is what traverses, thwarts, and denies at once, the whole declaration, without offering any special matter whereby to evade it. As in trespass either *vi et armis*, or on the case, "*non culpabilis, not guilty*;" in debt upon contract, "*nihil debet, he owes nothing*;" in debt on bond, "*non est factum, it is not his deed*;" on an *assumpsit*, "*non assumpsit, he made no such promise*." Or in real actions, "*nul tort, no wrong done*; *nul disseisin, no disseisin*;" and in a writ of right, the mise or issue is, that "the tenant has more right to hold than the demandant has to demand." These pleas are called the *general issue*, because, by importing an absolute and general denial of what is alleged in the declaration, they amount at once to an issue; by which we mean a fact affirmed on one side and denied on the other.

2. *Special pleas in bar* of the plaintiff's demands are very various, according to the circumstances of the defendant's case. As, in real actions, a general release or a fine; both of which may destroy and bar the plaintiff's title. Or, in personal actions, an accord, arbitration, conditions performed, nonage of the defendant, or some other fact which precludes the plaintiff from his action. A *justification* is likewise a special plea in bar; as in actions of assault and battery, *son assault demesne*, that it was the plaintiff's own original fault; in trespass, that the defendant did the thing complained of in right of some office which warranted him so to do; or, in an action of slander, that the plaintiff is really as bad a man as the defendant said he was.

Also a man may plead the statutes of limitation in bar; or the time limited by certain acts of parliament, beyond which no plaintiff can lay his cause of action. This, by the statute of 32 Hen. VIII. c. 2. in a writ of right is 60 years: in assises, writs of entry, or other possessory actions real, of the seisin of one's ancestors in lands; and either of their seisin, or one's own, in rents, suits, and services, 50 years: and in actions real for lands grounded upon one's own seisin or possession, such possession must have been within 30 years. By statute 1 Mar. II. c. 5. this limitation does not extend to any suit for avowsons. But by the statute

21 Jac. I. c. 2. a time of limitation was extended to the case of the king; viz. 60 years precedent to 19th Feb. 1623; but, this becoming ineffectual by efflux of time, the same date of limitation was fixed by statute 9 Geo. III. c. 16. to commence and be reckoned backwards, from the time of bringing any suit or other process to recover the thing in question; so that a possession for 60 years is now a bar even against the prerogative, in derogation of the ancient maxim, *Nullum tempus occurrit regi*. By another statute, 21 Jac. I. c. 16. 20 years is the time of limitation in any writ of formdon: and, by a consequence, 20 years is also the limitation in every action of ejectment; for no ejectment can be brought, unless where the lessor of the plaintiff is entitled to enter on the lands, and by the statute 21 Jac. I. c. 16. no entry can be made by any man, unless within 20 years after his right shall accrue. Also all actions of trespass (*quare clausum fregit*, or otherwise) detinue, trover, replevin, account, and case, (except upon accounts between merchants), debt on simple contract, or for arrears of rent, are limited by the statute last mentioned to six years after the cause of action commenced: and actions of assault, menace, battery, mayhem, and imprisonment, must be brought within four years, and actions for words two years, after the injury committed. And by the statute 31 Eliz. c. 5. all suits, indiments, and informations, upon any penal statutes, where any forfeiture is to the crown, shall be sued within two years, and where the forfeiture is to a subject, within one year, after the offence committed, unless where any other time is specially limited by the statute. Lastly, by statute 10 W. III. c. 14. no writ of error, *scire facias*, or other suit, shall be brought to reverse any judgment, fine, or recovery, for error, unless it be prosecuted within 20 years. The use of these statutes of limitation is to preserve the peace of the kingdom, and to prevent those innumerable perjuries which might ensue if a man were allowed to bring an action for any injury committed at any distance of time. Upon both these accounts the law therefore holds, that *interest reipublice ut sit finis litium*: and upon the same principle the Athenians laws in general prohibited all actions where the injury was committed five years before the complaint was made. If therefore, in any suit, the injury, or cause of action, happened earlier than the period expressly limited by law, the defendant may plead the statutes of limitations in bar: as upon an *assumpsit*, or promise to pay money to the plaintiff, the defendant may plead, *Non assumpsit infra sex annos*. He made no such promise within six years; which is an effectual bar to the complaint.

An *estoppel* is likewise a special plea in bar; which happens where a man hath done some act, or executed some deed, which estops or precludes him from averring any thing to the contrary. As if a tenant for years (who hath no freehold) levies a fine to another person. Tho' this is void as to strangers, yet it shall work as an estoppel to the cognizor; for, if he afterwards brings an action to recover these lands, and his fine is pleaded against him, he shall thereby be estopped from saying, that he had no freehold at the time, and therefore was incapable of levying it.

The conditions and qualities of a plea (which, as

Plea.

well as the doctrine of estoppels, will also hold equally, *mutatis mutandis*, with regard to other parts of pleading), are, 1. That it be single and containing only one matter; for duplicity begets confusion. But by statute 4 & 5 Ann. c. 16. a man, with leave of the court, may plead two or more distinct matters or single pleas; as in an action of assault and battery, these three, Not guilty, *son assault demesne*, and the statute of limitations. 2. That it be direct and positive, and not argumentative. 3. That it have convenient certainty of time, place, and persons. 4. That it answer the plaintiff's allegations in every material point. 5. That it be so pleaded as to be capable of trial.

Special pleas are usually in the affirmative, sometimes in the negative, but they always advance some new fact not mentioned in the declaration; and then they must be averred to be true in the common form:—"And this he is ready to verify."—This is not necessary in pleas of the general issue, those always containing a total denial of the facts before advanced by the other party, and therefore putting him upon the proof of them. See PLEADINGS.

*Blackst. Comment.* PLEA to Indictment, the defensive matter alleged by a criminal on his indictment: (See ARRAIGNMENT.) This is either, 1. A plea to the jurisdiction; 2. A demurrer; 3. A plea in abatement; 4. A special plea in bar; or, 5. The general issue.

I. A plea to the *jurisdiction*, is where an indictment is taken before a court that hath no cognizance of the offence; as if a man be indicted for a rape at the sheriff's tourn, or for treason at the quarter-sessions: in these or similar cases, he may except to the jurisdiction of the court, without answering at all to the crime alleged.

II. A *demurrer* to the indictment, is incident to criminal cases, as well as civil, when the fact as alleged is allowed to be true, but the prisoner joins issue upon some point of law in the indictment, by which he insists, that the fact, as stated, is no felony, treason, or whatever the crime is alleged to be. Thus, for instance, if a man be indicted for feloniously stealing a greyhound; which is an animal in which no valuable property can be had, and therefore it is not felony, but only a civil trespass, to steal it; in this case the party indicted may demur to the indictment; denying it to be felony, though he confesses the act of taking it. Some have held, that if, on demurrer, the point of law be adjudged against the prisoner, he shall have judgment and execution, as if convicted by verdict. But this is denied by others, who hold, that in such case he shall be directed and received to plead the general issue. Not guilty, after a demurrer determined against him. Which appears the more reasonable, because it is clear, that if the prisoner freely discovers the fact in court, and refers it to the opinion of the court whether it be felony or no; and upon the fact thus shewn, it appears to be felony, the court will not record the confession, but admit him afterwards to plead not guilty. And this seems to be a case of the same nature, being for the most part a mistake in point of law, and in the conduct of his pleading; and, though a man by mispleading may in some cases lose his property, yet the law will not suffer him by such niceties to lose his life. However, upon this doubt, demurrers

Plea.

to indictments are seldom used: since the same advantages may be taken upon a plea of not guilty; or afterwards, in arrest of judgment, when the verdict has established the fact.

III. A plea in *abatement* is principally for a *misnomer*, a wrong name, or a false addition to the prisoner. As, if James Allen, gentleman, is indicted by the name of *John Allen, esquire*, he may plead that he has the name of *James*, and not of *John*; and that he is a *gentleman*, and not an *esquire*. And, if either fact is found by a jury, then the indictment shall be abated, as writs or declarations may be in civil actions. But, in the end, there is little advantage accruing to the prisoner by means of these dilatory pleas; because, if the exception be allowed, a new bill of indictment may be framed, according to what the prisoner in his plea avers to be his true name and addition. For it is a rule, upon all pleas in abatement, that he who takes advantage of a flaw, must at the same time shew how it may be amended. Let us therefore next consider a more substantial kind of plea, *viz.*

IV. Special pleas in bar; which go to the merits of the indictment, and give a reason why the prisoner ought not to answer it at all, nor put himself upon his trial for the crime alleged. These are of four kinds: a former acquittal, a former conviction, a former attainder, or a pardon. There are many other pleas which may be pleaded in bar of an appeal: but these are applicable to both appeals and indictments.

1. First, the plea of *auterfoits acquit*, or a former acquittal, is grounded on this universal maxim of the common law of England, that no man is to be brought into jeopardy of his life, more than once, for the same offence. And hence it is allowed as a consequence, that when a man is once fairly found not guilty upon any indictment, or other prosecution, before any court having competent jurisdiction of the offence, he may plead such acquittal in bar of any subsequent accusation for the same crime.

2. Secondly, the plea of *auterfoits convict*, or a former conviction for the same identical crime, though no judgment was ever given, or perhaps will be, (being suspended by the benefit of clergy or other causes), is a good plea in bar to an indictment. And this depends upon the same principle as the former, that no man ought to be twice brought in danger of his life for one and the same crime.

3. Thirdly, the plea of *auterfoits attain*, or a former attainder, is a good plea in bar, whether it be for the same or any other felony. For wherever a man is attainted of felony, by judgment of death either upon a verdict or confession, by outlawry, or heretofore by abjuration, and whether upon an appeal or an indictment; he may plead such attainder in bar to any subsequent indictment or appeal, for the same or for any other felony. And this because, generally, such proceeding on a second prosecution cannot be to any purpose; for the prisoner is dead in law by the first attainder, his blood is already corrupted, and he hath forfeited all that he had: so that it is absurd and superfluous to endeavour to attain him a second time. Though to this general rule, as to all others, there are some exceptions; wherein, *cessante ratione, cessat et ipsa lex*.

4. Lastly,

4. Lastly, a pardon may be pleaded in bar; as at once destroying the end and purpose of the indictment, by remitting that punishment, which the prosecution is calculated to inflict. There is one advantage that attends pleading a pardon in bar, or in arrest of judgment, before sentence is past; which gives it by much the preference to pleading it after sentence or attainer. This is, that by stopping the judgment it stops the attainer, and prevents the corruption of the blood; which, when once corrupted by attainer, cannot afterwards be restored, otherwise than by act of parliament.

V. The *general issue*, or plea of not guilty, upon which plea alone the prisoner can receive his final judgment of death. In case of an indictment of felony or treason, there can be no special justification put in by way of plea. As, on an indictment for murder, a man cannot plead that it was in his own defence against a robber on the highway, or a burglar; but he must plead the general issue, Not guilty, and give this special matter in evidence. For (besides that these pleas do in effect amount to the general issue; since, if true, the prisoner is most clearly not guilty) as the facts in treason are laid to be done *proditore et contra ligeantie sue debitum*; and, in felony, that the killing was done *felonice*; these charges, of a traitorous or felonious intent, are the points and very gist of the indictment, and must be answered directly, by the general negative, Not guilty; and the jury upon the evidence will take notice of any defensive matter, and give their verdict accordingly as effectually as in if it were or could be specially pleaded. So that this is, upon all accounts, the most advantageous plea for the prisoner.

When the prisoner hath thus pleaded not guilty, *non culpabilis*, or *nient culpable*: which was formerly used to be abbreviated upon the minutes, thus, *Non* (or *nient*) *cul.* the clerk of the assize, or clerk of arraigns, on behalf of the crown replies, that the prisoner is guilty, and that he is ready to prove him so. This is done by two monosyllables in the same spirit of abbreviation, *cul. prit.*: which signifies first that the prisoner is guilty, (*cul. culpable*, or *culpabilis*); and then that the king is ready to prove him so, (*prit, presto sum*, or *paratus, verificare*). By this replication the king and the prisoner are therefore at issue: for when the parties come to a fact which is affirmed on one side and denied on the other, then they are said to be at issue in point of fact: which is evidently the case here, in the plea of *non cul.* by the prisoner; and the replication of *cul.* by the clerk.

How the courts came to express a matter of this importance in so odd and obscure a manner, can hardly be pronounced with certainty. It may perhaps, however, be accounted for by supposing, that these were at first short notes, to help the memory of the clerk, and remind him what he was to reply; or else it was the short method of taking down in court, upon the minutes, the replication and averment; *cul. prit.*: which afterwards the ignorance of succeeding clerks adopted for the very words to be

by them spoken (A).

But however it may have arisen, the joining of issue seems to be clearly the meaning of this obscure expression; which has puzzled our most ingenious etymologists, and is commonly understood as if the clerk of the arraigns, immediately on plea pleaded, had fixed an opprobrious name on the prisoner, by asking him, "*culprit*, how wilt thou be tried?" for immediately upon issue joined it is inquired of the prisoner, by what trial he will make his innocence appear. This form has at present reference to appeals and approvals only, wherein the appellee has his choice, either to try the accusation by BATTLE or by JURY. But upon indictments, since the abolition of ORDEAL, there can be no other trial but by jury, *per pais*, or by the country: and therefore, if the prisoner refuses to put himself upon the ineffectual in the usual form, that is, to answer that he will be tried by God and the country, if a commoner; and, if a peer, by God and his peers; the indictment, if in treason, is taken *pro confesso*; and the prisoner, in cases of felony, is judged to stand mute, and, if he perseveres in his obduracy, shall now be convicted of the felony.

When the prisoner has thus put himself upon his trial, the clerk answers in the humane language of the law, which always hopes that the party's innocence rather than his guilt may appear, "God send thee a good deliverance." And then they proceed, as soon as conveniently may be, to the trial. See the article TRIAL.

PLEADINGS, in law, are the mutual altercations between the plaintiff and defendant, (see SUIT, WRIT, and PROCESS). They form the third part or stage of a fact; and at present are set down and delivered into the proper office in writing, though formerly they were usually put in by their counsel *ore tenus*, or *viva voce*, in court, and then minuted down by the chief clerks or prothonotaries; whence, in our old law-French, the pleadings are frequently denominated the *parol*.

The first of these is the *declaration, narratio*, or *count*, anciently called the *tale*; in which the plaintiff sets forth his cause of complaint at length: being indeed only an amplification or exposition of the original writ upon which his action is founded, with the additional circumstances of time and place, when and where, the injury was committed.

In local actions, where possession of land is to be recovered, or damages for an actual trespass, or for waste, &c. affecting land, the plaintiff must lay his declaration, or declare his injury to have happened in the very county and place that it really did happen; but in *transitory* actions, for injuries that might have happened any where, as debt, detinue, slander, and the like, the plaintiff may declare in what county he pleases, and then the trial must be in that county in which the declaration is laid. Though, if the defendant will make affidavit that the cause of action, if any, arose not in that but in another county, the court will direct a change of the *venue* or *visite*, (that is, the *vicinia* or neighbourhood in which the injury

Black's  
Comment.

(A) Of this ignorance we may see daily instances, in the abuse of two legal terms of ancient French: one, the prodigious to all proclamations, "*Oyez*, or Hear ye," which is generally pronounced, most unmeaningly, "O yes;" the other, a more pardonable mistake, viz. when a jury are all sworn, the officer bids the crier number them, for which the word in law-French is, "*Countez*;" but we now hear it pronounced in very good English, "Count these."

Pleadings. is declared to be done), and will oblige the plaintiff to declare in the proper county. For the statute 6 Ric. II. c. 2. having ordered all writs to be laid in their proper counties, this, as the judges conceived, impowered them to change the *venue*, if required, and not to insist rigidly on abating the writ: which practice began in the reign of James the first. And this power is discretionally exercised, so as not to cause but prevent a defect of justice. Therefore the court will not change the *venue* to any of the four northern counties, previous to the spring circuit; because there the assizes are holden only once a-year, at the time of summer circuit. And it will sometimes remove the *venue* from the proper jurisdiction, (especially of the narrow and limited kind), upon a suggestion, duly supported, that a fair and impartial trial cannot be had therein.

It is generally usual, in actions upon the case, to set forth several cases, by different counts in the same declaration; so that if the plaintiff fails in the proof of one, he may succeed in another. As in an action on the case upon an *ASSUMPSIT* for goods sold and delivered, the plaintiff usually counts or declares, first, upon a settled and agreed price between him and the defendant; as, that they bargained for 20 l.: and left he should fail in the proof of this, he counts likewise upon a *quantum valebant*; that the defendant bought other goods, and agreed to pay him so much as they were reasonably worth: and then avers, that they were worth other 20 l. and so on in three or four different shapes; and at last concludes with declaring, that the defendant had refused to fulfil any of these agreements, whereby he is endangered to such a value. And if he proves the case laid in any one of his counts, though he fails in the rest, he shall recover proportionable damages. This declaration always concludes with these words, "and thereupon he brings suit," &c. *inde producit sectam, &c.* By which words, *suit* or *secta*, (*a sequendo*), were anciently understood the witnesses or followers of the plaintiff. For in former times, the law would not put the defendant to the trouble of answering the charge till the plaintiff had made out at least a probable case. But the actual production of the *suit, secta*, or *followers*, is now antiquated, and hath been totally disused, at least ever since the reign of Edward III. though the form of it still continues.

At the end of the declaration are added also the plaintiff's common pledges of prosecution, John Doe and Richard Roe; which, as we elsewhere observed, (*see WRIT*), are now mere names of form; though formerly they were of use to answer to the king for the amercement of the plaintiff, in case he were nonsuited, barred of his action, or had a verdict and judgment against him. For if the plaintiff neglects to deliver a declaration for two terms after the defendant appears, or is guilty of other delays or defaults against the rules of law in any subsequent stage of the action, he is adjudged not to follow or pursue his remedy as he ought to do; and thereupon a *non-suit*, or *non prosecutur*, is entered, and he is said to be *non prof'd.* And for thus deserting his complaint, after making a false claim or complaint, (*pro falso clamore fact.*) he shall not only pay costs to the defendant, but is liable to be amerced to the king. A *retraxit* dis-

fers from a non-suit, in that the one is negative and the other positive: the non-suit is a default and neglect of the plaintiff, and therefore he is allowed to begin his suit again upon payment of costs; but a *retraxit* is an open and voluntary renunciation of his suit in court; and by this he for ever loses his action. A *discontinuance* is somewhat similar to a non-suit; for when a plaintiff leaves a chasm in the proceedings of his cause, as by not continuing the process regularly from day to day, and time to time, as he ought to do, the suit is discontinued, and the defendant is no longer bound to attend; but the plaintiff must begin again, by suing out a new original, usually paying costs to his antagonist.

When the plaintiff hath stated his case in the declaration, it is incumbent on the defendant, within a reasonable time, to make his defence, and to put in a plea; or else the plaintiff will at once recover judgment by *default*, or *nihil dicit*, of the defendant.

Defence, in its true legal sense, signifies not a justification, protection, or guard, which is now its popular signification; but merely an *opposing* or *denial* (from the French verb *defender*) of the truth or validity of the complaint. It is the *contestatio litis* of the civilians: a general assertion that the plaintiff hath no ground of action; which assertion is afterwards extended and maintained in his plea.

Before defence made, if at all, cognizance of the suit must be claimed or demanded; when any person or body-corporate hath the franchise, not only of holding pleas within a particular limited jurisdiction, but also of the cognizance of pleas; and that either without any words exclusive of other courts, which entitles the lord of the franchise, whenever any suit that belongs to his jurisdiction is commenced in the courts at Westminster, to demand the cognizance thereof; or with such exclusive words, which also entitle the defendant to plead to the jurisdiction of the court. Upon this claim of cognizance, if allowed, all proceedings shall cease in the superior court, and the plaintiff is left at liberty to pursue his remedy in the special jurisdiction. As, when a scholar or other privileged person of the universities of Oxford or Cambridge is impleaded in the courts at Westminster, for any cause of action whatsoever, unless upon a question of freehold. In these cases, by the charter of those learned bodies, confirmed by act of parliament, the chancellor, or vice-chancellor, may put in a claim of cognizance; which, if made in due time and form, and with due proof of the facts alleged, is regularly allowed by the courts. It must be demanded before full defence is made or imparlance prayed; for these are a submission to the jurisdiction of the superior court, and the delay is a *laches* in the lord of the franchise: and it will not be allowed if it occasions a failure of justice, or if an action be brought against the person himself who claims the franchise, unless he hath also a power in such case of making another judge.

After defence made, the defendant must put in his plea. But before he defends, if the suit is commenced by *capias* or *latitat*, without any special original, he is entitled to demand one *imparlance*, or *licentia loquendi*; and may, before he pleads, have more granted by consent of the court, to see if he can end the matter amicably without farther suit, by talking with the

Pleadings.

the plaintiff: a practice which is supposed to have arisen from a principle of religion, in obedience to that precept of the gospel, "agree with thine adversary quickly, whilst thou art in the way with him." And it may be observed, that this gospel-precept has a plain reference to the Roman law of the twelve tables, which expressly directed the plaintiff and defendant to make up the matter, while they were in the way, or going to the pretor;—*in via, rem uti pacunt orato*. There are also many other previous steps which may be taken by a defendant before he puts in his plea. He may, in real actions, demand a view of the thing in question, in order to ascertain its identity and other circumstances. He may crave *oyer* of the writ, or of the bond, or other specialty upon which the action is brought; that is, to hear it read to him; the generality of defendants in the times of ancient simplicity being supposed incapable to read it themselves: whereupon the whole is entered *verbatim* upon the record; and the defendant may take advantage of any condition, or other part of it, not stated in the plaintiff's declaration. In real actions also the tenant may pray in *aïd*, or call for assistance of another, to help him to plead, because of the feebleness or imbecility of his own estate. Thus a tenant for life may pray in aid of him that hath the inheritance in remainder or reversion; and an incumbent may pray in aid of the patron and ordinary; that is, that they shall be joined in the action, and help to defend the title. *Voucher* also is the calling in of some person to answer the action, that hath warranted the title to the tenant or defendant. This we still make use of in the form of common recoveries, which are grounded on a writ of entry; a species of action that relies chiefly on the weakness of the tenant's title, who therefore vouches another person to warrant it. If the vouchee appears, he is made defendant instead of the voucher; but if he afterwards makes default, recovery shall be had against the original defendant; and he shall recover an equivalent in value against the deficient vouchee. In assizes, indeed, where the principal question is, whether the demandant or his ancestors were or were not in possession till the ouster happened, and the title of the tenant is little (if at all) discussed, there no voucher is allowed; but the tenant may bring a writ of *warrantia chartæ* against the warrantor, to compel him to assist him with a good plea or defence, or else to render damages and the value of the land, if recovered against the tenant. In many real actions also, brought by or against an infant under the age of 21 years, and also in actions of debt brought against him, as heir to any deceased ancestor, either party may suggest the nonage of the infant, and pray that the proceedings may be deferred till his full age, or, in our legal phrase, that the infant may have his age, and that the *parol* may *demur*, that is, that the pleadings may be staid; and then they shall not proceed till his full age, unless it be apparent that he cannot be prejudiced thereby. But by the statutes of Westm. 1. 3 Edw. I. c. 46. and of Gloucester, 6 Edw. I. c. 2. in writs of entry *sur disseisin* in some particular cases, and in actions unceitrel brought by an infant, the *parol* shall not *demur*; otherwise he might be deforced of his whole property: and even want a maintenance, till he came of age.

Pleadings.

So likewise in a writ of dower the heir shall not have his age; for it is necessary that the widow's claim be immediately determined, else she may want a present subsistence. Nor shall an infant patron have it in a *quare impedit*, since the law holds it necessary and expedient, that the church be immediately filled.

When these proceedings are over, the defendant must then put in his excuse or plea. See PLEA.

It is a rule in pleading, that no man be allowed to plead specially such a plea as amounts only to the general issue, or a total denial of the charge; but in such case he shall be driven to plead the general issue in terms, whereby the whole question is referred to a jury. But if the defendant, in an assize or action of trespass, be desirous to refer the validity of his title to the court rather than the jury, he may state his title specially, and at the same time give colour to the plaintiff, or suppose him to have an appearance or colour of title, bad indeed in point of law, but of which the jury are not competent judges. As if his own true title is, that he claims by feoffment with livery from A, by force of which he entered on the lands in question, he cannot plead this by itself, as it amounts to no more than the general issue, *nul tort, nul disseisin*, in assize, or *not guilty* in an action of trespass. But he may allege this specially, provided he goes farther, and says, that the plaintiff claiming by colour of a prior deed of feoffment, without livery, entered; upon whom he entered; and may then refer himself to the judgment of the court which of these two titles is the best in point of law.

When the plea of the defendant is thus put in, if it does not amount to an issue or total contradiction of the declaration, but only evades it, the plaintiff may plead again, and reply to the defendant's plea: Either traversing it, that is, totally denying it; as if, on an action of debt upon bond, the defendant pleads *soluit ad diem*, that he paid the money when due; here the plaintiff in his replication may totally traverse this plea, by denying that the defendant paid it: Or he may allege new matter in contradiction to the defendant's plea; as when the defendant pleads no award made, the plaintiff may reply, and set forth an actual award, and assign a breach: Or the replication may confess and avoid the plea, by some new matter or distinction, consistent with the plaintiff's former declaration; as in an action for trespassing upon land whereof the plaintiff is seized, if the defendant shews a title to the land by descent, and that therefore he had a right to enter, and gives colour to the plaintiff, the plaintiff may either traverse and totally deny the fact of the descent; or he may confess and avoid it, by replying, that true it is that such descent happened, but that since the descent the defendant himself demised the lands to the plaintiff for term of life. To the replication the defendant may *rejoin*, or put in an answer called a *rejoinder*. The plaintiff may answer the rejoinder by a *sur-rejoinder*; upon which the defendant may *rebut*, and the plaintiff answer him by a *sur-rebutter*. Which pleas, replications, rejoinders, sur-rejoinders, rebutters, and sur-rebutters answer to the *exceptio, replicatio, duplicatio, triplicatio, and quadruplicatio*, of the Roman laws.

The whole of this process is denominated the *pleading*; in the several stages of which it must be carefully ob-

*Pleadings.* observed, not to depart or vary from the title or defence which the party has once insisted on. For this (which is called a *departure* in pleading) might occasion endless altercation. Therefore the replication must support the declaration, and the rejoinder must support the plea, without departing out of it. As in the case of pleading no award made in consequence of a bond of arbitration, to which the plaintiff replies, setting forth an actual award; now the defendant cannot rejoin that he hath performed this award, for such rejoinder would be an entire departure for his original plea, which alleged that no such award was made: therefore he has now no other choice, but to traverse the fact of the replication, or else to demur upon the law of it.

Again, all duplicity in pleading must be avoided. Every plea must be simple, entire, connected, and confirmed to one single point: it must never be entangled with a variety of distinct independent answers to the same matter; which must require as many different replies, and introduce a multitude of issues upon one and the same dispute. For this would often embarrass the jury, and sometimes the court itself, and at all events would greatly enhance the expence of the parties. Yet it frequently is expedient to plead in such a manner as to avoid any implied admission of a fact, which cannot with propriety or safety be positively affirmed or denied. And this may be done by what is called a *protestation*; whereby the party interposes an oblique allegation or denial of some fact, protesting (by the gerund, *protestando*) that such a matter does or does not exist; and at the same time avoiding a direct affirmation or denial. Sir Edward Coke hath defined a protestation (in the pithy dialect of that age) to be "an exclusion of a conclusion." For the use of it is, to save the party from being concluded with respect to some fact or circumstance which cannot be directly affirmed or denied without falling into duplicity of pleading; and which yet, if he did not thus enter his protest, he might be deemed to have tacitly waived or admitted. Thus, while tenure in villenage subsisted, if a villein had brought an action against his lord, and the lord was inclined to try the merits of the demand, and at the same time to prevent any conclusion against himself that he had waived his signiory; he could not in this case both plead affirmatively that the plaintiff was his villein, and also take issue upon the demand; for then his plea would have been double, as the former alone would have been a good bar to the action: but he might have alleged the villenage of the plaintiff by way of protestation, and then have denied the demand. By this means the future vassalage of the plaintiff was saved to the defendant, in case the issue was found in his (the defendant's) favour; for the protestation prevented that conclusion which would otherwise have resulted from the rest of his defence, that he had enfranchised the plaintiff, since no villein could maintain a civil action against his lord. So also if a defendant, by way of inducement to the point of his defence, alleges (among other matters) a particular mode of feisin or tenure which the plaintiff is unwilling to admit, and yet desires to take issue on the principal point of the defence, he must deny the feisin or tenure by way of protestation, and then traverse the defensive matter. So, lastly, if an award be set forth by the plaintiff, and he can assign a breach in one part of it (*viz.* the

non-payment of a sum of money) and yet is afraid to admit the performance of the rest of the award, or to aver in general a non-performance of any part of it, lest something should appear to have been performed; he may save to himself any advantage he might hereafter make of the general non-performance, by alleging that by protestation, and plead only the non-payment of the money.

In any stage of the pleadings, when either side advances or affirms any new matter, he usually (as was said) avers it to be true; "and this he is ready to verify." On the other hand, when either side traverses or denies the facts pleaded by his antagonist, he usually tenders an *issue*, as it is called; the language of which is different according to the party by whom it is tendered: for if the traverse or denial comes from the defendant, the issue is tendered in this manner, "And of this he puts himself upon the country," thereby submitting himself to the judgment of his peers: but if the traverse lies upon the plaintiff, he tenders the issue or prays the judgment of the peers against the defendant in another form; thus, "And this he prays may be inquired of by the country."

But if either side (as, for instance, the defendant) pleads a special negative plea, not traversing or denying any thing that was before alleged, but disclosing some new negative matter; as where the suit is on a bond conditioned to perform an award, and the defendant pleads, negatively, that no award was made; he tenders no issue upon this plea, because it does not yet appear whether the fact will be disputed, the plaintiff not having yet asserted the existence of any award: but when the plaintiff replies, and sets forth an actual specific award, if then the defendant traverses the replication, and denies the making of any such award, he then, and not before, tenders an issue to the plaintiff. For when, in the course of pleading, they come to a point which is affirmed on one side and denied on the other, they are then said to be at issue; all their debates being at last contracted into a single point, which must now be determined either in favour of the plaintiff or of the defendant. See the article *ISSUE*, in the APPENDIX.

*PLEASURE and PAIN*, says Mr Locke, are simple ideas which we receive both from sensation and reflection; these being thoughts of the mind, as well as sensations accompanied with pleasure and pain. See *METAPHYSICS*, n<sup>o</sup> 71, 72.

*PLEBEIAN*, any person of the rank of the common people. It is chiefly used in speaking of the ancient Romans, who were divided into senators, patricians, and plebeians. The distinction was made by Romulus the founder of the city; who confined all dignities, civil, military, and sacerdotal, to the rank of patricians. But, to prevent the seditions which such a distinction might produce through the pride of the higher order and the envy of the lower, he endeavoured to engage them to one another by reciprocal ties and obligations. Every plebeian was allowed to choose, out of the body of the patricians, a protector, who should be obliged to assist him with his interest and substance, and to defend him from oppression. These protectors were called *patrons*; the protected, *clients*. It was the duty of the patron to draw up the contracts of the clients, to extricate them out of their difficulties

Pledge  
||  
Plenitude.

culties and perplexities, and to guard their ignorance against the artfulness of the crafty. On the other hand, if the patron was poor, his clients were obliged to contribute to the portions of his daughters, the payment of his debts, and the ransom of him and his children if they happened to be taken in war. The client and patron could neither accuse, nor bear witness against each other; and if either of them was convicted of having violated this law, the crime was equal to that of treason, and any one might with impunity slay the offender as a victim devoted to Pluto and the infernal gods. For more than 600 years, we find no dissensions nor jealousies between the patrons and their clients; not even in the times of the republic, when the people frequently mutinied against the great and powerful.

**PLEDGE**, (*Plegius*), in common law, a surety, or gage, either real or personal, which the plaintiff or demandant is to find for his prosecuting the suit.

The word is sometimes also used for **FRANK Pledge**, which see.

To **PLEDGE**, in drinking, denotes to warrant, or be surety to one, that he shall receive no harm while he is taking his draught.—The phrase is referred by our antiquaries, to the practice of the Danes, heretofore in England, who frequently used to stab, or cut the throats of the natives, while they were drinking.

**PLEDGERY**, or **PLEGGERY**, in law, suretiship, or an undertaking or answering for another.

**PLEDGES of Goods** for money. See **PAWN**, in the **APPENDIX**.

**PLEDGET**, **BOLSTER**, or *Compress*, in surgery, a kind of flat tent laid over a wound, to imbibе the superfluous humours, and to keep it clean.

**PLEIADES**, in fabulous history, the seven daughters of Atlas king of Mauritania, and Pleione, were thus called from their mother. They were Maia, Electra, Taygete, Asterope, Merope, Halcyone, and Celeno: and were also called *Atlantides*, from their father Atlas. These princesses were carried off by Búris, king of Egypt; but Hercules having conquered him, delivered them to their father: yet they afterwards suffered a new persecution from Orion, who pursued them five years, till Jove, being prevailed on by their prayers, took them up into the heavens, where they form the constellation which bears their name.

**PLEIADES**, in astronomy, an assemblage of seven stars, in the neck of the constellation Taurus.

They are thus called from the Greek *πλῆν*, *navigare*, "to sail;" as being terrible to mariners, by reason of the rains and storms that frequently rise with them. The Latins called them *vergiliae*, from *ver*, "spring;" because of their rising about the time of the vernal equinox. The largest is of the third magnitude, and is called *lucide pleiadum*.

**PLENARY**, something complete or full. Thus we say the pope grants *plenary* indulgences; i. e. full and entire remissions of the penalties due to all sins. See **INDULGENCE**.

**PLENIPOTENTIARY**, a person vested with full power to do any thing. See **AMBASSADOR**.

**PLENITUDE**, the quality of a thing that is full, or that fills another. In medicine, it chiefly denotes a redundancy of blood and humours.

Plenum,  
Plenus.

**PLENUM**, in physics, denotes, according to the Cartesians, that state of things wherein every part of space is supposed to be full of matter, in opposition to a **VACUUM**.

**PLENUS FLOS**, a full flower; a term expressive of the highest degree of luxuriance in flowers. The petals in full flowers are so multiplied as to exclude all the stamina, and frequently to choke up the female organ; so that such flowers, although the most delightful to the eye, are both vegetable monsters, and, according to the sexualists, vegetable eunuchs; the unnatural increase of the petals constituting the first; the consequent exclusion of the stamina or male organs, the latter.

Flowers with more petals than one, are most liable to this, as well as the inferior degrees of luxuriance. The following are well known examples; ranunculus, anemone, marsh-marygold, columbine, fennel-flower, poppy, pæony, pink, gilliflower, campion, viscous campion, lily, crown imperial, tulip, narcissus, rocket, mallow, Syrian mallow, apple, pear, peach, cherry, almond, myrtle, rose, and strawberry.

Flowers with one petal, are more rarely subject to fullness; that they are not, however, totally exempted, appears from polianthus, hyacinth, primrose, crocus, meadow-saffron, and thorn-apple, tho' Kramer has asserted that a full flower with one petal is a contradiction in terms.

In flowers with one petal, the mode of luxuriance, or impletion, is by a multiplication of the divisions of the limb or upper part; in flowers with more petals than one, by a multiplication of the petals or nectarium.

To take a few examples. Columbine is rendered full in three different ways: 1. By the multiplication of its petals, and total exclusion of the nectaria; 2. By the multiplication of the nectaria, and exclusion of the petals; or, 3. By such an increase of the nectaria only as does not exclude the petals, between each of which are interjected three nectaria, placed one within another. Again, fennel-flower is rendered full, by an increase of the nectaria only; narcissus, either by a multiplication of its cup and petals, or of its cup only; lark-spur, commonly by an increase of the petals, and exclusion of the spur, which is its nectarium. In *saponaria concava anglica*, the impletion is attended with the singular effect of incorporating the petals, and reducing their number from five to one; and in gelder rose, the luxuriance is effected by an increase both in magnitude and number of the plains, wheel-shaped, barren florets of the circumference or margin of the head of flowers; and an exclusion of all the bell-shaped hermaphrodite florets of the centre or disk.

Hitherto we have treated of plenitude in simple flowers only: the instance just now adduced seems to connect the different modes of impletion in them and compound flowers. Before proceeding further, however, it will not be improper to premise, that as a simple luxuriant flower is frequently, by beginners, mistaken for a compound flower in a natural state, such flowers may always be distinguished with certainty by this rule: That in simple flowers, however luxuriant, there is but one *pistillum*, or female organ; whereas in compound flowers, each floret, or partial flower, is furnished

**Pleus.** nished with its own proper *pitillum*. Thus in hawkweed, a compound flower, each flat or tongue-shaped floret in the aggregate has its five stamina and naked seed; which last is, in effect, its *pitillum*; whereas, in a luxuriant lychnis, which is a simple flower, there is found only one *pitillum*, or female organ, common to the whole.

In a compound radiated flower, which generally consists of plain florets in the margin or radius, and tubular or hollow florets in the centre or disc; plenitude is effected either by an increase of the florets in the margin, and a total exclusion of those in the disc; which mode of luxuriance is termed *impletion* by the *radii*, and resembles what happens in the gelder-rose; or by an elongation of the hollow florets in the centre, and a less profound division of their brims; which is termed *impletion* by the *disc*. In the first mode of luxuriance, the florets in the centre, which are always hermaphrodite or male, are entirely excluded; and in their place succeed florets similar in sex to those of the radius. Now, as the florets in the margin of a radiated compound flower, are found to be always either female; that is, furnished with the *pitillum* only; or neuter, that is, furnished with neither stamina nor *pitillum*; it is evident, that a radiated compound flower, filled with the radius, will either be entirely female, as in feverfew, daisy, and African marygold; or entirely neuter, as in sun-flower, marygold, and centaury: hence it will always be easy to distinguish such a luxuriant flower from a compound flower with plain florets in a natural state; as these florets are all hermaphrodite; that is, furnished with both stamina and *pitillum*. Thus the full flowers of African marygold have each floret furnished with the *pitillum* or female organ only: the natural flowers of dandelion, which, like the former, is composed of plain florets, are furnished with both stamina and *pitillum*.

In the second mode of luxuriance, termed *impletion* by the *disc*, the florets in the margin sometimes remain unchanged; but most commonly adopt the figure of those in the centre, without, however, suffering any alteration in point of sex; so that confusion is less to be apprehended from this mode of luxuriance than from the former; besides, the length to which the florets in the centre run out is of itself a sufficient distinction, and adapted to excite at once an idea of luxuriance. Daisy, feverfew, and African marygold, exhibit instances of this as well as of the former mode of impletion.

In luxuriant compound flowers with plain florets, the *semisifoliosi* of Tournefort, the stigma or summit of the style in each floret is lengthened, and the seed-buds are enlarged and diverge; by which characters such flowers may always be distinguished from flowers of the same kind in a natural state. Scorzoneria, nipplewort, and goat's-beard, furnish frequent instances of the plenitude alluded to.

Lastly, the impletion of compound flowers with tubular or hollow florets, the *sifoliosi* of Tournefort, seems to observe the same rules as that of radiated flowers just delivered. In everlasting-flower, the *xanthanthemum* of Linnaeus, the impletion is singular, being effected by the enlargement and expansion of the inward chaffy scales of the calix. These scales, which become coloured, are greatly augmented in length, fo

as to overtop the florets, which are scarce larger than those of the same flower in a natural state. The florets too in the margin, which in the natural flower are female, become, by luxuriance, barren; that is, are deprived of the *pitillum*; the style, which was very short, spreads, and is of the length of the chaffy scales; and its summits, formerly two in number, are metamorphosed into one.

Full flowers are more easily referred to their respective genera in methods founded upon the calix, as the flower-cup generally remains unaffected by this highest degree of luxuriance.

**PLEONASM**, a figure in rhetoric, whereby we use words seemingly superfluous, in order to express a thought with the greater energy; such as, "I saw it with my own eyes," &c. See ORATORY, n° 64.

**PLETHORA**, in medicine, from *πλεθος*, "plenitude." A plethora is when the vessels are too much loaded with fluids. The plethora may be sanguine or serous. In the first there is too much crassamentum in the blood, in the latter too little. In a sanguine plethora there is danger of a fever, inflammation, apoplexy, rupture of the blood-vessels, obstruited secretions, &c.: In a serous, a dropsy, &c. A rarefaction of the blood produces all the effects of a plethora; it may accompany a plethora, and should be distinguished therefrom. Mr Bromfield observes, that a sanguine plethora may thus be known to be present by the pulse. An artery overcharged with blood is as incapable of producing a strong full pulse, as one that contains a deficient quantity; in both cases, there will be a low and weak pulse. To distinguish rightly, the pulse must not be felt with one or two fingers on the carpal artery; but if three or four fingers cover a considerable length of the artery, and we press hard for some time on it, and then suddenly raise all these fingers except that which is nearest to the patient's hand, the influx of the blood, if there is a plethora, will be so rapid as to raise the other finger, and make us sensible of the fulness. The sanguine plethora is relieved by bleeding; the serous by purging, diuretics, and sweating.

**PLEURA**, in anatomy, a thin membrane covering the inside of the thorax. See ANATOMY, n° 377.

**PLEURONECTES**, in ichthyology, a genus belonging to the order of thoracici. Both eyes are on the same side of the head; there are from four to five rays in the gill-membrane; the body is compressed; the one side resembling the back, the other the belly. There are 17 species; the most remarkable are,

1. The hippoglossus, or holibut. This is the largest of the genus: some have been taken in our seas weighing from 100 to 300 pounds; but much larger are found in those of Newfoundland, Greenland, and Iceland, where they are taken with a hook and line in very deep water. They are part of the food of the Greenlanders, who cut them into large slips, and dry them in the sun. They are common in the London markets, where they are exposed to sale cut into large pieces. They are very coarse eating, excepting the part which adheres to the side-fins, which is extremely fat and delicious, but surfeiting. They are the most voracious of all flat fish. There have been instances of their swallowing the lead weight at the end of a line, with which the scamen were sounding the bottom

Pleonasm  
Pleuronectes.

Pleuronectes.

tom from on board a ship. The holibut, in respect to its length, is the narrowest of any of this genus except the sole. It is perfectly smooth, and free from spines either above or below. The colour of the upper part is dusky; beneath, of a pure white. We do not count the rays of the fins in this genus; not only because they are so numerous, but because nature hath given to each species characters sufficient to distinguish them by. These flat fish swim sideways; for which reason Linnæus hath styled them *pleuronectes*.

2. The plaice, or plaie, are very common on most of our coasts, and sometimes taken of the weight of 15 pounds; but they seldom reach that size, one of eight or nine pounds being reckoned a large fish. The best and largest are taken off Rye on the coast of Sussex, and also off the Dutch coasts. They spawn in the beginning of February. They are very flat, and much more square than the preceding. Behind the left eye is a row of six tubercles, that reaches to the commencement of the lateral line. The upper part of the body and fins is of a clear brown, marked with large bright orange-coloured spots: the belly is white.

3. The flcus, or flounder, inhabits every part of of the British sea, and even frequents our rivers at a great distance from the salt waters; and for this reason some writers call it the *passer fluviatilis*. It never grows large in our rivers, but is reckoned sweeter than those that live in the sea. It is inferior in size to the plaice, seldom or never weighing more than six pounds. It may very easily be distinguished from the plaice, or any other fish of this genus, by a row of sharp small spines that surround its upper sides, and are placed just at the junction of the fins with the body. Another row marks the side-line, and runs half way down the back. The colour of the upper part of the body is a pale brown, sometimes marked with a few obscure spots of dirty yellow: the belly is white.

4. The limanda, or dab, is found with the other species, but is less common. It is in best season during February, March, and April: they spawn in May and June, and become flabby and watery the rest of summer. They are superior in goodness to the plaice and flounder, but far inferior in size. It is generally of an uniform brown colour on the upper side, though sometimes clouded with a darker. The scales are small and rough, which is a character of this species. The lateral line is extremely incurvated at the beginning, then goes quite straight to the tail. The lower part of the body is white.

5. The solea, or sole, is found on all our coasts; but those on the western shores are much superior in size to those of the north. On the former they are sometimes taken of the weight of six or seven pounds, but towards Scarborough they rarely exceed one pound; if they reach two, it is extremely uncommon. They are usually taken in the trawl-net: they keep much at the bottom, and feed on small shell-fish. It is of a form much more narrow and oblong than any other of the genus. The irides are yellow; the pupils of a bright sapphire colour: the scales are small, and very rough: the upper part of the body is of a deep brown; the tip of one of the pectoral fins, black; the under part of the body, white: the lateral line is straight; the tail rounded at the end. It is a fish of a

very delicate flavour; but the small soles are much superior in goodness to large ones. By the ancient laws of the Cinque Ports, no one was to take soles from the 1st of November to the 15th of March; neither was any body to fish from sun-setting to sun-rising, that the fish might enjoy their night-food. The chief fishery for them is at Brixham in Torbay.

6. The maximus, or turbot, grows to a very large size; Mr Pennant has seen them of 23 pounds weight, but has heard of some that weighed 30. They are taken chiefly off the north coast of England, and others off the Dutch coast.

The large turbot, and several other kinds of flat fish, are taken by the hook and line, for they lie in deep water: the method of taking them in wares, or flaked nets, is too precarious to be depended on for the supply of our great markets, because it is by mere accident that the great fish stray into them. The following is the method of fishing for turbot followed at Scarborough: When they go out to fish, each person is provided with three lines. Each man's lines are fairly coiled upon a flat oblong piece of wicker-work; the hooks being baited, and placed very regularly in the centre of the coil. Each line is furnished with 14 score of hooks, at the distance of six feet two inches from each other. The hooks are fastened to the lines upon strands of twisted horse-hair, 27 inches in length. When fishing, there are always three men in each coble; and consequently nine of these lines are fastened together, and used as one line, extending in length near three miles, and furnished with 2520 hooks. An anchor and a buoy are fixed at the first end of the line, and one more of each at the end of each man's lines; in all four anchors, which are commonly perforated stones, and four buoys made of leather or cork. The line is always laid across the current. The tides of flood and ebb continue an equal time upon our coast; and, when undisturbed by winds, run each way about six hours. They are so rapid, that the fishermen can only shoot and haul their lines at the turn of tide; and therefore the lines always remain upon the ground about six hours. The same rapidity of tide prevents their using hand-lines; and therefore two of the people commonly wrap themselves in the fail, and sleep, while the other keeps a strict look-out, for fear of being run down by ships, and to observe the weather. For storms often rise so suddenly, that it is with extreme difficulty they can sometimes escape to the shore, leaving their lines behind. The coble is 20 feet 6 inches long, and 5 feet extreme breadth. It is about one ton burden, rowed with three pair of oars, and admirably constructed for the purpose of encountering a mountainous sea: they hoist sail when the wind suits. The five-men boat is 40 feet long and 15 broad, and of 25 tons burden; it is so called, though navigated by six men and a boy, because one of the men is commonly hired to cook, &c. and does not share in the profits with the other five. All our able fishermen go in these boats to the herring-fishery at Yarmouth the latter end of September, and return about the middle of November. The boats are then laid up until the beginning of Lent; at which time they go off in them to the edge of the Dogger, and other places, to fish for turbot, cod, ling, skait, &c. They always take two cobiles on board; and when they come upon their

Pleuronectes.

Pleurone-  
ces  
+  
Plica.

ground, anchor the boat, throw out the cobbles, and fish in the same manner as those do who go from the shore in a coble; with this difference only, that here each man is provided with double the quantity of lines, and instead of waiting the return of tide in the coble, return to the boat and bait their other lines; thus hawling one fet, and shooting another every turn of tide. They commonly run into harbour twice a-week to deliver their fish. The five-men boat is decked at each end, but open in the middle, and has two large lug-sails. The best bait for all kinds of fish is fresh herring cut in pieces of a proper size; and notwithstanding what has been said to the contrary, they are taken here at any time in the winter, and all the spring, whenever the fishermen put down their nets for that purpose. The five-men boats always take some nets for that end. Next to herrings are the lesser lampreys, which come all winter by land-carriage from Tadeaster. The Dutch also use these fish as baits in the turbot fishery, and purchase annually from the Thames fishermen as much as amounts to 700*l.* worth for that purpose. The next baits in esteem are small haddocks cut in pieces, sand-worms, muscles, and limpets (called here *fiddlers*); and, lastly, when none of these can be had, they use bullock's liver. The hooks used here are much smaller than those employed at Iceland and Newfoundland. Experience has shewn, that the larger fish will take a living small one upon the hook, sooner than any bait that can be put on; therefore they use such as the small fish can swallow. The hooks are two inches and an half long in the shank, and near an inch wide between the shank and the point. The line is made of small cording, and is always tanned before it is used.

Turbots, and all the rays, are extremely delicate in their choice of baits. If a piece of herring or haddock has been 12 hours out of the sea, and then used as bait, they will not touch it. This species is of a remarkable square form: the colour of the upper part of the body is cinereous, marked with numbers of black spots of different sizes: the belly is white; the skin is without scales, but greatly wrinkled, and mixed with small short spines, dispersed without any order.

PLEXUS, among anatomists, a bundle of small vessels interwoven in the form of net-work: thus a congeries of vessels within the brain is called *plexus choroides, reticularis, or retiformis*. See ANATOMY, n<sup>o</sup> 397. c.

A plexus of nerves is an union of two or more nerves, forming a sort of ganglion or knot.

PLICA POLONICA, in medicine, a disease of the hair, almost peculiar to Poland and Lithuania; and hence denominated *polonica*. It consists of a preternatural bulk of the hair, which being firmly conglutinated and wrapped up in inextricable knots, and extended to a monstrous length, affords a very unseemly spectacle. When these are cut off, the blood is discharged from them, the head racked with pain, the sight impaired, and the patient's life frequently endangered.

This disorder is supposed to arise from the sordid and nasty manner of life to which these people are addicted, and from an hereditary fault conveyed from the parents, which consists in too great a bulk of the pores and bulbous hairs under the skin of the head:

hence the thick and glutinous nutritious juice, produced by their coarse aliments and impure waters, is by heat forced into the cavities of the hairs, and sweating through their pores, produces this terrible diftase.

A perfect method of curing this disorder is unknown; undoubtedly because, in those parts of Poland in which this diftase is endemial, there have been few physicians who, from what is commonly known of the nature and cure of the plica polonia, have been able to lay down a rational and judicious plan for treating it. It is certain, that purging and venesection are so far from being beneficial in this disorder, that they often prove hurtful, by throwing the peccant humours into violent commotions, and more effectually distributing them through the whole body. It is therefore most safe and expedient to solicit the peccant matter to the hairs, to which it naturally tends: and this intention, Senertus says, is most effectually answered by lotions of bear's-breech.

PLINTH, ORLE, or ORLO, in architecture, a flat square member, in the form of a brick. It is used as the foundation of columns, being that flat square table under the moulding of the base and pedestal at the bottom of the whole order. It seems to have been originally intended to keep the bottom of the original wooden pillars from rotting. Vitruvius also calls the tuscan abacus *plinth*.

PLINTH of a Statue, &c. is a base, either flat, round, or square, that serves to support it.

PLINTH of a Wall, denotes two or three rows of bricks advancing out from a wall; or, in general, any flat high moulding, that serves in a front-wall to mark the floors, to sustain the eaves of a wall, or the larmier of a chimney.

PLINY the ELDER, or *Cæcilius Plinius Secundus*, one of the most learned men of ancient Rome, was descended from an illustrious family, and born at Verona. He bore arms in a distinguished post; was one of the college of Augurs; became intendant of Spain; and was employed in several important affairs by Vespasian and Titus, who honoured him with their esteem. The eruption of Mount Vesuvius, which happened in the year 79, proved fatal to him. His nephew, Pliny the Younger, relates the circumstances of that dreadful eruption, and the death of his uncles, in a letter to Tacitus. Pliny the Elder wrote a Natural History in 37 books, which is still extant, and has had many editions; the most esteemed of which is that of Father Hardouin, printed at Paris in 1723, in two volumes folio.

PLINY, the Younger, nephew of the former, was born in the ninth year of Nero, and the 62d of Christ, at Novocomum, a town upon the lake Larius, near which he had several beautiful villas. Cæcilius was the name of his father, and Plinius Secundus that of his mother's brother, who adopted him. He brought into the world with him fine parts and an elegant taste, which he did not fail to cultivate early; for, as he tells us himself, he wrote a Greek tragedy at 14 years of age. He lost his father when he was young; and had the famous Virginius for his tutor or guardian, whom he has set in a glorious light. He frequented the schools of the rhetoricians, and heard Quintilian; for whom he ever after entertained so high an esteem, that he bestowed a considerable portion

Plinth,  
Pliny.

upon

Pliny.

upon his daughter at her marriage. He was in his 18th year when his uncle died; and it was then that he began to plead in the forum, which was the usual road to dignities. About a year after, he assumed the military character, and went into Syria with the commission of tribune: but this did not suit his taste any more than it had done Tully's; and therefore we find him returning after a campaign or two. He tells us, that in his passage homewards he was detained by contrary winds at the island Icaria, and how he employed himself in making verses: he enlarges in the same place upon his poetical exertions; yet poetry was not the shining part of his character, any more than it had been of Tully's.

Upon his return from Syria, he married a wife, and settled at Rome: it was in the reign of Domitian. During this most perilous time, he continued to plead in the forum, where he was distinguished not more by his uncommon abilities and eloquence, than by his great resolution and courage, which enabled him to speak boldly, when none else durst scarcely speak at all. On these accounts he was often singled out by the senate, to defend the plundered provinces against their oppressive governors, and to manage other causes of a like important and dangerous nature. One of these was for the province of Bœtica, in their prosecution of Bæbius Massa; in which he acquired so general an applause, that the emperor Nerva, then a private man, and in banishment at Tarentum, wrote him a letter, in which he congratulated not only Pliny, but the age which had produced an example so much in the spirit of the ancients. Pliny relates this affair in a letter to Cornelius Tacitus; and he was so pleased with it himself, that he could not help intreating this friend to record it in his history. He intreats him, however, with infinitely more modesty than Tully had intreated Luceius upon the same occasion: and though he might imitate Cicero in the request, as he professes to have constantly set that great man before him for a model, yet he took care not to transgress the bounds of decency in his manner of making it. He obtained the offices of questor and tribune, and luckily went unhurt through the reign of Domitian: there is, however, reason to suppose, if that emperor had not died just as he did, that Pliny would have shared the fate of many other great men; for he tells us himself, that his name was afterwards found in Domitian's tablets, among the number of those who were destined to destruction.

He lost his wife in the beginning of Nerva's reign, and soon after took his beloved Calpurnia, of whom we read so much in his Epistles. He had not however any children by any of his wives: and hence we find him thanking Trajan for the *ius trium liberorum*, which he afterwards obtained of that emperor for his friend Suetonius Tranquillus. He hints also, in his letter of thanks to Trajan, that he had been twice married in the reign of Domitian. He was promoted to the consulate by Trajan in the year 100, when he was 38 years of age; and in this office pronounced that famous panegyric, which has ever since been admired, as well for the copiousness of the topics, as the elegance of address. Then he was elected augur, and afterwards made proconsul of Bithynia, from whence he wrote to Trajan that curious letter concerning the primitive

Christians; which, with Trajan's rescript, is happily extant among his Epistles. Pliny's letter, as Mr Melmoth observes in a note upon the passage, is esteemed as almost the only genuine monument of ecclesiastical antiquity relating to the times immediately succeeding the apostles, it being written at most not above 40 years after the death of St Paul. It was preserved by the Christians themselves, as a clear and unsuspicious evidence of the purity of their doctrines; and is frequently appealed to by the early writers of the church against the calumnies of their adversaries. It is not known what became of Pliny after his return from Bithynia; whether he lived at Rome, or what time he spent at his country-houses. Antiquity is also silent as to the time of his death: but it is conjectured that he died either a little before or soon after that excellent prince, his admired Trajan; that is, about the year of Christ 116.

Pliny was one of the greatest wits, and one of the worthiest men, among the ancients. He had fine parts, which he cultivated to the utmost; and he accomplished himself with all the various kinds of knowledge which could serve to make him either useful or agreeable. He wrote and published a great number of things; but nothing has escaped the wreck of time, except the books of Letters, and the panegyric upon Trajan. This has ever been considered as a masterpiece: and if he has, as some think, almost exhausted all the ideas of perfection in a prince, and gone perhaps a little beyond the truth, yet it is allowed that no panegyrist was ever possessed of a finer subject, and on which he might better indulge in all the flow of eloquence, without incurring the suspicion of flattery and lies. His letters seem to have been intended for the public; and in them he may be considered as writing his own memoirs. Every epistle is a kind of historical sketch, wherein we have a view of him in some striking attitude, either of active or contemplative life. In them are preserved anecdotes of many eminent persons, whose works are come down to us, as Suetonius, Silius Italicus, Martial, Tacitus, and Quintilian; and of curious things, which throw great light upon the history of those times. They are written with great politeness and spirit; and if they abound too much in turn and metaphor, we must impute it to that degeneracy of taste which was then accompanying the degenerate manners of Rome. Pliny however seems to have preserved himself in this latter respect from the general contagion: whatever the manners of the Romans were, his were pure and incorrupt. His writings breathe a spirit of transcendent goodness and humanity: his only imperfection is, he was too desirous that the public and posterity should know how humane and good he was. We have two elegant English translations of his Epistles; the one by Mr Melmoth, and the other by Lord Orrery.

PLOCE. See ORATORY, n° 67.

PLOT (Dr Robert), a learned antiquarian and philosopher, was born at Sutton-barn, in the parish of Borden in Kent, in the year 1641, and studied in Magdalen-hall, and afterwards in university-college, Oxford. In 1682 he was elected secretary of the Royal Society, and published the Philosophical Transactions from N° 143 to N° 166 inclusive. The next year Elias Ashmole, Esq; appointed him first keeper of his museum,

Pliny  
Plot.

Plot,  
Plotinus.

feum, and about the same time the vice-chancellor nominated him first professor of chemistry in that university. In 1687 he was made secretary to the Earl Marshall, and the following year received the title of *historiographer* to King James II. In 1690 he resigned his professorship of chemistry, and likewise his place of keeper of the museum, to which he presented a very large collection of natural curiosities; which were those he had described in his histories of Oxfordshire and Staffordshire: the former published at Oxford in 1677, folio, and reprinted with additions and corrections in 1705; and the latter was printed in the same size in 1686. In January 1694-5, Henry Howard, Earl Marshall, nominated him Mobrai-herald extraordinary; two days after which he was constituted register of the court of honour; and, on the 30th of April 1696, he died of the stone at his house in Borden.

As Dr Plot delighted in natural history, the above works were designed as essays towards a Natural History of England; and he had actually formed a design of travelling through England and Wales for that purpose. He accordingly drew up a plan of his scheme in a letter to the learned Bishop Fell; which is inserted at the end of the second volume of Leland's Itinerary, of the edition of 1744. Besides the above works, he published *De origine fontium tentamen philosophicum*, 8vo. and nine papers in the Philosophical Transactions.

Plot, in dramatic poetry, is sometimes used for the fable of a tragedy or comedy; but more particularly the knot or intrigue, which makes the *embarras* of any piece. See POETRY.

Plot, in surveying, the plan or draught of any field, farm, or manor, surveyed with an instrument, and laid down in the proper figure and dimensions.

PLOTINUS, a Platonic philosopher in the third century. His genius was greatly superior to the vulgar herd of philosophers, and was very singular and extraordinary. At 28 years of age he had a strong desire to study philosophy, on which occasion he was recommended to the most famous professors of Alexandria. He was not satisfied with their lectures; but, upon hearing those of Ammonius, he confessed that this was the man he wanted. He studied for 11 years under that excellent master, and then went to hear the Persian and Indian philosophers. He afterwards read lectures of philosophy at Rome; and in the 50th year of his age, Porphyry became his disciple. Porphyry being resolved to have every thing fully explained, Plotinus, to give him that satisfaction, was induced to write many books; 24 of which he composed during the six years that Porphyry was his disciple; and these, added to 21 that he had written before Porphyry's arrival, with nine he composed after Porphyry's leaving Rome, made in all 54 books, which are divided into six Enneades, and are all upon very abstruse subjects. However, we may discover in them the traces of a fruitful, elevated, vast, and penetrating genius, and a close method of reasoning. The Romans had a high veneration for him; and he passed for a man of such judgment and virtue, that many persons of both sexes, when they found themselves dying, intrusted him, as a kind of guardian angel, with the care of their estates and children. He was the arbiter of numberless law-suits; and constantly behaved with such

humanity and rectitude of mind; that he did not create himself one enemy during the 26 years he resided in Rome. He, however, did not meet with the same justice from all of his own profession; for a philosopher of Alexandria, being envious of his glory, used his utmost endeavours, though in vain, to ruin him. The emperor Gallienus, and the empress Salonina, had a very high regard for him; and, had it not been for the opposition of some jealous courtiers, they would have had the city of Campania rebuilt, and given to him with the territory belonging to it, to establish a colony of philosophers, and to have it governed by the ideal laws of Plato's commonwealth. He laboured under various disorders during the last year of his life, which obliged him to leave Rome, when he was carried to Campania to the heirs of one of his friends, who furnished him with every thing necessary; and there he died in the year 270, aged 66. His 54 books are printed in Greek, with a Latin version, contents, and an analysis of each book, by Marcillus Vicinus. His life was written by Porphyry, the most illustrious of his disciples.

PLOUGH, in agriculture, a machine for turning up the soil, contrived to save the time, labour, and expences, that, without this instrument, must have been employed in digging land, to prepare for the sowing of all kinds of grain. See AGRICULTURE, n° 77, &c.

PLOUGHMAN, the person who guides the plough in the operation of tilling.

PLOUGHING, in agriculture, the turning up the earth with a plough. See AGRICULTURE, Part II. *passim*.

PLOVER, in ornithology, a species of CHARADRIUS.

These birds usually fly in exceedingly large flocks in the places they frequent; people talk of 20,000 or 30,000 being seen in a flock. They generally come to us in September, and leave us about the end of March. In cold weather they are found very commonly on lands lying near the sea, in quest of food; but in thaws and open seasons, they go higher up in the country.

They love to feed on ploughed lands, but never remain long at a time on them, for they are very cleanly in their nature; and the dirt which lodges on their beaks and feet, give them so much uneasiness, that they fly to the nearest water to wash themselves. When they rook, they do not go to trees or hedges; but sit squatting on the ground like ducks or geese, far from trees or hedges, when the weather is calm; but when it is stormy, they often get under shelter. In wet weather they do not sleep in the night at all, but run about picking up the worms as they crawl out of the ground; during this feeding they are continually making a small cry, that serves to keep them together, and in the morning they take flight. If in their flight they spy any others on the ground, they call them up; and if they refuse to come, the whole body descends to see what food there is in the place that detains them.

Plovers are very easily taken at the time of their first coming over, when they have not got any other birds mixed among them; but when they afterwards pick up the teal and other shy birds among them, it becomes more difficult. The best season for taking them is in October; especially in the beginning of that month: after this they grow timorous, and are not easily

Plough  
||  
Plover.

Plowden.  
Plumbery.

easily taken again till March, which is the time of their coupling. The severest frosts are not the best season for taking them in net, but variable weather does better. The north-west wind is found disadvantageous to the taking of them; and in general, great regard is to be paid to the course of the wind in the setting of the nets. All sea-fowl fly against the wind when the land lies that way; and the acts for taking them are therefore to be placed in a proper direction accordingly.

PLOWDEN (Edmund), serjeant at law, was the son of Humphrey Plowden, of Plowden in Shropshire, of an ancient and gentle family. He was first a student of the university of Cambridge, where he spent three years in the study of philosophy and medicine. He then removed to Oxford, where, having continued his former studies about four years more, in 1552 he was admitted to the practice of physic and surgery: but probably finding the practice of the art of healing less agreeable than the study, he entered himself of the Middle Temple, and began to read law. Wood says, that in 1557 he was summer-reader to that society, and Lent-reader three years after, being then serjeant, and oracle of the law. He died in the year 1584, aged 67; and was buried in the Temple church, near the north wall, at the east end of the choir. He married the daughter of William Sheldon of Boley in Worcestershire; by whom he had a son, who died soon after his father. He wrote, 1. Commentaries or Reports of divers Cases, &c. in the reigns of king Ed. VI. queen Mary, and queen Elizabeth; Lond. 1571, 78, 99, 1613, &c. Written in the old Norman language. 2. Queries, or a Moot-book of cases, &c. translated, methodized, and enlarged, by H. B. of Lincoln's-inn; Lond. 1662, 8vo.

PLUG, certain pieces of timber, formed like the frustum of a cone, and used to stop the haufe-holes, and the breaches made in the body of a ship by cannon-balls; the former of which are called *haufe-plugs*, and the latter *shot-plugs*, which are formed of various sizes in proportion to the holes made by the different sizes of shot, which may penetrate the ship's sides or bottom in battle; accordingly they are always ready for this purpose.

PLUKENET (Leonard), a physician who flourished in the reign of king Charles II. was one of the most excellent and laborious botanists of that or any other age. He was author of the *Phytographia Plukenetianæ*, the *Almagesticum Britannicum*, and other works of the like kind, on which he spent the greatest part of his life and fortune. His Phytography is mentioned with the highest encomiums in the Philosophical Transactions for February 1696-7. His *Opera Botanica*, with cuts, were printed at London in 6 vols, fol. in 1720.

PLUM-TREE, in botany. See PRUNUS.

PLUMAGE, the feathers which serve birds for a covering. See ORNITHOLOGY, p. 5757.

PLUMB-LINE, among artificers, denotes a perpendicular to the horizon; so called, as being commonly erected by means of a plummet.

PLUMBERY, the art of casting and working lead, and using it in building.

As this metal melts soon and with little heat, it is easy to cast it into figures of any kind, by running it into moulds of brass, clay, plaster, &c. But the

chief article in plumbery is sheets and pipes of lead; Plumbery. and as these make the basis of the plumber's work, we shall here give the process of making them.

In casting *sheet-lead*, a table or mould is made use of, which consists of large pieces of wood well jointed, and bound with bars of iron at the ends; on the sides of which runs a frame consisting of a ledge or border of wood, three inches thick, and four inches high from the mould, called the *sharps*: the ordinary width of the mould, within these sharps, is from four to five feet; and its length is 16, 17, or 18 feet. This should be something longer than the sheets are intended to be, in order that the end where the metal runs off from the mould may be cut off, because it is commonly thin, or uneven, or ragged at the end. It must stand very even or level in breadth, and something falling from the end in which the metal is poured in, viz. about an inch, or an inch and a half, in the length of 16 or 17 feet or more, according to the thinness of the sheets wanted; for the thinner the sheet, the more declivity the mould should have. At the upper end of the mould stands the pan, which is a concave triangular prism, composed of two planks nailed together at right angles, and two triangular pieces fitted in between them at the ends. The length of this pan is the whole breadth of the mould in which the sheets are cast; it stands with its bottom, which is a sharp edge, on a form at the end of the mould, leaning with one side against it; and on the opposite side is a handle to lift it up by, to pour out the melted lead; and on that side of the pan next the mould, are two iron-hooks to take hold of the mould, and prevent the pan from slipping while the melted lead is pouring out of it into the mould. This pan is lined on the inside with moistened sand, to prevent it from being fired by the hot metal. The mould is also spread over, about two inches thick, with sand sifted and moistened, which is rendered perfectly level by moving over it a piece of wood called a *strike*, and smoothing it over with a smoothing plane, which is a plate of polished brass, about one-fourth of an inch thick, and nine inches square, turned up on all the four edges, and with a handle fitted on to the upper or concave side. The sand being thus smoothed, it is fit for casting sheets of lead: but if they would cast a cistern, they measure out the bigness of the four sides; and having taken the dimensions of the front or fore-part, make mouldings by pressing long slips of wood, which contain the same mouldings, into the level sand; and form the figures of birds, beasts, &c. by pressing in the same manner leaden figures upon it, and then taking them off, and at the same time smoothing the surface where any of the sand is raised up by making these impressions upon it. The rest of the operation is the same in casting either cisterns or plain sheets of lead: but before we proceed to mention the manner in which that is performed, it will be necessary to give a more particular description of the *strike*. The strike, then, is a piece of board about five inches broad, and something longer than the breadth of the mould on the inside; and at each end is cut a notch, about two inches deep, so that when it is used, it rides upon the sharps with those notches. Before they begin to cast, the strike is made ready by tacking on two pieces of an old hat on the notches, or by slipping a

cape

**Plumbery.** cafe of leather over each end, in order to raife the under fide about one-eighth of an inch, or fomething more, above the fand, according as they would have the fheet to be in thicknefs; then they tallo the under edge of the ftrike, and lay it acrofs the mould. The lead being melted, it is put into the pan with ladles, in which, when there is a fufficient quantity for the prefent purpofe, the fcum of the metal is fwept off with a piece of board to the edge of the pan, letting it fettle on the fand, which is by this means prevented from falling into the mould at the pouring out of the metal. When the lead is cool enough, which much be regulated according to the thicknefs of the fheets wanted, and is known by its beginning to ftand with a fhell or wall on the fand round the pan, two men take the pan by the handle, or elfe one of them lift it by the bar and chain fixed to a beam in the ceiling, and pour it into the mould, while another man ftands ready with the ftrike, and, as foon as they have done pouring in the metal, puts on the mould, fweeps the lead forward, and draws the overplus into a trough prepared to receive it. The fheets being thus caft, nothing remains but to roll them up, or cut them into any meafure wanted: but if it be a ciftern, it is bent into four fides, fo that the two ends may join the back, where they are foldred together; after which the bottom is foldred up.

*The method of cafting pipes without foldering.* To make thefe pipes they have a kind of little mill, with arms or levers to turn it withal. The moulds are of brafs, and confift of two pieces, which open and fhut by means of hooks and hinges, their inward caliber or diameter being according to the fize of the pipe, ufually two feet and a half. In the middle is placed a core or round piece of brafs or iron, fomewhat longer than the mould, and of the thicknefs of the inward diameter of the pipe. This core is paffed through two copper rundles, one at each end of the mould, which they ferve to clofe; and to thefe is joined a little copper tube about two inches long, and of the thicknefs the leaden pipe is intended to be of. By means of thefe tubes, the core is retained in the middle of the cavity of the mould. The core being in the mould, with the rundles at its two ends, and the lead melted in the furnace, they take it up in a ladle, and pour it into the mould by a little aperture at one end, made in the form of a funnel. When the mould is full, they pafs a hook into the end of the core, and, turning the mill, draw it out; and then opening the mould, take out the pipe. If they defire to have the pipe lengthened, they put one end of it in the lower end of the mould, and pafs the end of the core into it; then fhut the mould again, and apply its rundle and tube as before, the pipe juft caft ferving for rundle, &c. at the other end. Things being thus replaced, they pour in frefh metal, and repeat the operation till they have got a pipe of the length required.

For making pipes of fhcet-lead, the plumbers have wooden cylinders, of the length and thicknefs required; and on thefe they form their pipes by wrapping the fhcet around them, and foldring up the edges all along them.

**PLUMBUM, LEAD.** See **LEAD**.

**PLUMBUM Corneum**, a combination of lead with the marine acid. See **CHEMISTRY**, n<sup>o</sup> 249.

**PLUME**, in botany, the bud or germ. See **PLUM.**

**Plume.**  
**Plumofe.**

**PLUMIRE** (Charles), a learned Minim, born at Marseilles, and one of the moft able botanifts of the 17th century. He was inftructed by the famous Maignan, who taught him mathematics, turnery, the art of making fpectacles, burning-glaffes, microscopes, and other works. He at length went to Rome to perfect himfelf in his ftudies, and there applied himfelf entirely to botany under a fkillful Italian. At his return to Provence, he fettled in the convent at Bornes, a maritime place near Hieres, where he had the conveniency of making difcoveries in the fields with refpect to fimples. He was fome time after fent by the French king to America, to bring from thence fuch plants as might be of fervice in medicine. He made three different voyages to the Antilles, and ftopped at the ifland of St Domingo. The king honoured him with a penfion; and he at laft fettled at Paris. However, at the defire of M Fagon, he prepared to go a fourth time to America, to examine the tree which produces the Jefuits bark; but died at the port of Santa Maria, near Cadiz, in 1706. He wrote feveral excellent works; the principal of which are, 1. A volume of the plants in the American Iflands. 2. A treatife on the American fern. 3. The Art of Turnery; a curious work embellifhed with plates.

**PLUMMET**, **PLUMB-Rule**, or **Plumb-line**, an inftrument ufed by carpenters, mafons, &c. in order to judge whether walls, &c. be upright planes, horizontal, or the like. It is thus called from a piece of lead, faftened to the end of a chord, which ufually conftitutes this inftrument. Sometimes the ftring defends along a wooden ruler, &c. raifed perpendicularly on another; in which cafe it becomes a level.

**PLUMMING**, among miners, is the method of ufing a mine-dial, in order to know the exact place of the work where to fink down an air-fhaft, or to bring an adit to the work, or to know which way the lead inclines when any flexure happens in it.

It is performed in this manner: A fkillful perfon, with an affiftant, and with pen, ink, and paper, and a long line, and a fun-dial, after his guefs of the place above ground, defends into the adit or work, and there faftens one end of the line to fome fixed thing in it; then the incited necle is let to reft, and the exact point where it refts is marked with a pen: he then goes on farther in the line till faftened, and at the next flexure of the adit he makes a mark on the line by a knot or otherwife: and then letting down the dial again, he there likewife notes down that point at which the needle ftands in this fecond pofition. In this manner he proceeds, from turning to turning, marking down the points, and marking the line, till he comes to the intended place: this done, he afcends, and begins to work on the furface of the earth what he did in the adit, bringing the firft knot in the line to fuch a place where the mark of the place of the needle will again anfwer its pointing, and continues this till he come to the defired place above ground, which is certain to be perpendicular over the part of the mine into to which the air-fhaft is to be funk.

**PLUMOSE**, fomething formed in the manner of a feather, with a ftem and fibres iffuing from it on each

Plural  
||  
Plutarch.

each side; such are the antennæ of certain moths, butterflies, &c.

PLURAL, in grammar, an epithet applied to that number of nouns and verbs which is used when we speak of more than one thing. See GRAMMAR.

PLURALITY, a discrete quantity, consisting of two or a greater number of the same kind: thus we say, a plurality of gods, &c.

PLUS, in algebra, a character marked thus +, used for the sign of addition. See ALGEBRA, n° 2, 3.

PLUSH, in commerce, &c. a kind of stuff, having a sort of velvet knap, or flag, on one side, composed regularly of a woof of a single woollen thread, and a double warp; the one wool, of two threads twisted; the other goats or camels hair; tho' there are some plushes entirely of worsted, and others composed wholly of hair.

PLUTARCH, a great philosopher and historian of antiquity, who lived from the reign of Claudius to that of Hadrian, was born at Chæronea, a small city of Boeotia in Greece. Plutarch's family was ancient in Chæronea: his grandfather Lamprias was eminent for his learning, and a philosopher; and is often mentioned by Plutarch in his writings, as is also his father. Plutarch was initiated early in study, to which he was naturally inclined; and was placed under the care of Ammonius, an Egyptian, who, having taught philosophy with great reputation at Alexandria, from thence travelled into Greece, and settled at Athens. Under this master, he made great advances in knowledge; and like a thorough philosopher, more apt to regard things than words, he pursued this knowledge to the neglect of languages. The Roman language, at that time, was not only the language of Rome, but of Greece also; and much more used there than the French is now in England. Yet he was so far from regarding it then, that, as we learn from himself, he became not conversant in it till the declension of his life; and, though he is supposed to have resided in Rome near 40 years at different times, yet he never seems to have acquired a competent skill in it. But this was not the worst: he did not cultivate his mother-tongue with any great exactness; and hence that harshness, inequality, and obscurity in his style, which has so frequently and so justly been complained of.

After he was principled and grounded by Ammonius, having a soul insatiable of knowledge, he resolved to travel. Egypt was at that time, as formerly it had been, famous for learning; and probably the mystery-ness of their doctrine might tempt him, as it had tempted Pythagoras and others, to go and converse with the priesthood of that country. This appears to have been particularly his business, by his treatise, "Of Isis and Osiris;" in which he shews himself versed in the ancient theology and philosophy of the wise men. From Egypt he returned into Greece; and visiting in his way all the academies and schools of the philosophers, gathered from them many of those observations with which he has abundantly enriched posterity. He does not seem to have been attached to any particular sect, but culled from each of them whatever he thought excellent and worthy to be regarded. He could not bear the paradoxes of the Stoics, but yet was more averse from the impiety of the Epicureans: in many things he followed Aristotle; but his favourites

Plutarch.

were Socrates and Plato, whose memory he revered so highly, that he annually celebrated their birth-days with much solemnity. Besides this, he applied himself with extreme diligence to collect, not only all books that were excellent in their kind, but also all the sayings and observations of wise men, which he had heard in conversation, or had received from others by tradition; and likewise to consult the records and public instruments preserved in cities which he had visited in his travels. He took a particular journey to Sparta, to search the archives of that famous commonwealth, to understand thoroughly the model of their ancient government, the history of their legislators, their kings, and their ephori; and digested all their memorable deeds and sayings with much care. He took the same methods with regard to many other commonwealths; and thus was enabled to leave us in his works such a rich cabinet of observations upon men and manners, as, in the opinion of Montaigne and Bayle, have rendered him the most valuable author of antiquity.

The circumstances of Plutarch's life are not known, and therefore cannot be related with any exactness. He was married; and his wife's name was *Timoxena*, as Rualdus conjectures with probability. He had several children, and among them two sons; one called *Plutarch* after himself; the other *Lamprias*, in memory of his grandfather. Lamprias was he, of all his children, who seems to have inherited his father's philosophy; and to him we owe the table or catalogue of Plutarch's writings, and perhaps also his apophthegms. He had a nephew, Sextus Chæroneus, who taught the learned emperor Marcus Aurelius the Greek tongue, and was much honoured by him. Some think, that the critic Longinus was of his family; and Apuleius, in the first book of his *Metamorphoses*, affirms himself to be descended from him.

On what occasion, and at what time of his life, he went to Rome, how long he lived there, and when he finally returned to his own country, are all uncertain. It is probable, that the fame of him went thither before him, not only because he had published several of his works, but because immediately upon his arrival, as there is reason to believe, he had a great resort of the Roman nobility to hear him: for he tells us himself, that he was so taken up in giving lectures of philosophy to the great men of Rome, that he had not time to make himself master of the Latin tongue, which is one of the first things that would naturally have engaged his attention. It appears that he was several times at Rome; and perhaps one motive to his inhabiting there was the intimacy he had contracted in some of these journeys with *Sossius Senecio*, a great and worthy man, who had been four times consul, and to whom Plutarch has dedicated many of his lives. But the great inducement which carried him first to Rome, was undoubtedly that which had carried him into so many other parts of the world; namely, to make observations upon men and manners, and to collect materials for writing the lives of the Roman worthies, in the same manner as he had already written those of the Grecian; and accordingly he not only conversed with all the living, but searched the records of the Capitol, and of all the libraries. Not but, as we learn from Suidas, he was intrusted also with the

Plutarch.

management of public affairs in the empire, during his residence in the metropolis: "Plutarch (says he) lived in the time of Trajan, who bestowed on him the consular ornaments, and also caused an edict to be passed, that the magistrates or officers of Illyria should do nothing in that province without his knowledge and approbation."

When, and how, he was made known to Trajan, is likewise uncertain: but it is generally supposed, that Trajan, a private man when Plutarch first came to Rome, was, among other nobility, one of his auditors. It is also supposed, that this wise emperor made use of him in his councils; at least, much of the happiness of his reign has been imputed to Plutarch. We are equally at a loss concerning the time of his abode in the imperial city; which, however, at different times, is not imagined to fall much short of 40 years. The desire of visiting his native country, so natural to all men, and especially when growing old, prevailed with him at length to leave Italy; and at his return, he was unanimously chosen archon or chief magistrate of Chæroneæ, and not long after admitted into the number of the Delphic Apollo's priests. We have no particular account of his death, either as the manner of it, or the year; only it is evident that he lived, and continued his studies, to an extreme old age.

His works have been divided, and they admit of a pretty equal division, into Lives and Morals: the former of which, in his own estimation, were to be preferred as more noble than the latter. His style, as we have already observed, has been excepted to with some reason: he has also been criticised for some mistakes in Roman antiquities, and for a little partiality to the Greeks. On the other hand, he has been justly praised for the copiousness of his fine sense and learning, for his integrity, and for a certain air of goodness which appears in all he wrote. His business was not to please the ear, but to instruct and charm the mind; and in this none ever went beyond him.

PLUTO, in Pagan worship, the king of the in-

fernal regions, was the son of Saturn and Ops, and the brother of Jupiter and Neptune. This deity finding himself childless and unmarried, mounted his chariot to visit the world; and arriving in Sicily, fell in love with Proserpine, whom he saw gathering flowers with her companions in the valley of Ætna, near Mount Ætna; when forcing her into his chariot, he drove her to the river Chemarus, thro' which he opened himself a passage back to the realms of night. See CERES and PROSERPINE.

Pluto is usually represented in an ebony chariot drawn by four black horses; sometimes holding a sceptre, to denote his power; at others, a wand, with which he drives away the ghosts; and at others, some keys, to signify that he had the keys of death. Homer observes, that his helmet had the quality of rendering the wearer invisible, and that Minerva borrowed it in order to be concealed from Mars when he fought against the Trojans. Pluto was greatly revered both by the Greeks and Romans, who erected temples and altars to him. To this god sacrifices were offered in the night, and it was not lawful to offer them by day.

PLUTUS, in Pagan worship, the god of riches, is frequently confounded with Pluto. He was represented as appearing lame when he approached, and with wings at his departure; to show the difficulty of amassing wealth, and the uncertainty of its enjoyment. He was also frequently represented blind, to show that he often bestowed his favours on the most unworthy, and left in necessity those who had the greatest merit.

PLUVIALIS. See CHARADRIUS.

PLYING, in the sea-language, the act of making, or endeavouring to make, a progress against the direction of the wind. Hence a ship, that advances well in her course in this manner of sailing, is said to be a good plying. See the articles BEATING and TACKLING.

Pluto

Plying.

## P N E U M A T I C S.

**PNEUMATICS**, called also **PNEUMATOLOGY** and *Pneumatosophy*, among schoolmen, the doctrine and contemplation of spirits and spiritual substances, as God, angels, and the human soul; in which sense *pneumatics* are the same with what we otherwise call *metaphysics*. See the article **METAPHYSICS**.

**PNEUMATICS** is more commonly used among us for that branch of natural philosophy which treats of the weight, pressure, and elasticity of the AIR, and the effects arising from it.

### SECT. I. Of the Properties of Air.

The air is that thin transparent fluid body in which we live and breathe. It encompasses the whole earth to a considerable height; and, together with the clouds and vapours that float in it, is called the *atmosphere*. The air is justly reckoned among the number of fluids, because it has all the properties by which a fluid is distinguished. For, it yields to the least force impressed, its parts are easily moved among one ano-

ther, it presses according to its perpendicular height, and its pressure is every way equal.

That the air is a fluid, consisting of such particles as have no cohesion betwixt them, but easily glide over one another, and yield to the slightest impression, appears from that ease and freedom with which animals breathe in it, and move through it without any difficulty or sensible resistance.

But it differs from all other fluids in the three following particulars. 1. It can be compressed into a much less space than that which it naturally possesseth. 2. It cannot be congealed or fixed, as other fluids may. 3. It is of a different density in every part, upward from the earth's surface; decreasing in its weight, bulk for bulk, the higher it rises; and therefore must also decrease in density. 4. It is of an elastic or springy nature, and the force of its spring is equal to its weight.

That air is a body, is evident from its excluding all other bodies out of the space it possesses: for if a glass jar be plunged with its mouth downwards into

Properties  
of the Air.

a vessel of water, there will but very little water get into the jar, because the air of which it is full keeps the water out.

As air is a body, it must needs have gravity or weight: and that it is weighty, is demonstrated by experiment. For, let the air be taken out of a vessel by means of the air-pump, then having weighed the vessel, let in the air again, and upon weighing it, when re-filled with air, it will be found considerably heavier. Thus, a bottle that holds a wine quart, being emptied of air and weighed, is found to be about 17 grains lighter than when the air is let into it again; which shews that a quart of air weighs 17 grains. But a quart of water weighs 1462½ grains; thus divided by 17, quotes 860 in round numbers; which shews, that water is 860 times as heavy as air near the surface of the earth.

As the air rises above the earth's surface, it grows rarer, and consequently lighter, bulk for bulk. For since it is of an elastic or springy nature, and its lowermost parts are pressed with the weight of all that is above them, it is plain that the air must be more dense or compact at the earth's surface, than at any height above it; and gradually rarer the higher up. For the density of the air is always as the force that compresseth it: and therefore the air towards the upper parts of the atmosphere being less pressed than that which is near the earth, it will expand itself, and thereby become thinner than at the earth's surface.

Dr Cotes has demonstrated, that if altitudes in the air be taken in arithmetical proportion, the rarity of the air will be in geometrical proportion. For instance,

At the altitude of	7	-	-	-	-	4
	14	-	-	-	-	16
	21	-	-	-	-	64
	28	-	-	-	-	256

Miles above the surface of the earth, the air is times thinner and lighter than at the earth's surface.

And hence it is easy to prove by calculation, that a cubic inch of such air as we breathe would be so much rarefied at the altitude of 500 miles, that it would fill a sphere equal in diameter to the orbit of Saturn.

The weight or pressure of the air is exactly determined by the following experiment.

Take a glass tube about three feet long, and open at one end; fill it with quicksilver, and, putting your finger upon the open end, turn that end downward,

VOL. VIII.

2

Properties  
of the Air.

and immerse it into a small vessel of quicksilver, without letting in any air: then take away your finger, and the quicksilver will remain suspended in the tube 29½ inches above its surface in the vessel; sometimes more, and at other times less, as the weight of the air is varied by winds and other causes. That the quicksilver is kept up in the tube by the pressure of the atmosphere upon that in the bason, is evident; for, if the bason and tube be put under a glass, and the air be then taken out of the glass, all the quicksilver in the tube will fall down into the bason; and if the air be let in again, the quicksilver will rise to the same height as before. Therefore the air's pressure on the surface of the earth is equal to the weight of 29½ inches depth of quicksilver all over the earth's surface, at a mean rate.

A square column of quicksilver, 29½ inches high, and one inch thick, weighs just 15 pounds, which is equal to the pressure of air upon every square inch of the earth's surface; and 144 times as much, or 2160 pounds, upon every square foot; because a square foot contains 144 square inches. At this rate, a middle-sized man, whose surface may be about 14 square feet, sustains a pressure of 30240 pounds, when the air is of a mean gravity: a pressure which would be insupportable, and even fatal to us, were it not equal on every part, and counterbalanced by the spring of the air within us, which is diffused through the whole body, and re-acts with an equal force against the outward pressure.

Now, since the earth's surface contains (in round numbers) 200,000,000 square miles, and every square mile 27,878,400 square feet, there must be 5,575,680,000,000 square feet on the earth's surface; which multiplied by 2160 pounds (the pressure on each square foot) gives 12,043,468,800,000,000 pounds for the pressure or weight of the whole atmosphere.

When the end of a pipe is immersed in water, and the air is taken out of the pipe, the water will rise in it to the height of 33 feet above the surface of the water in which it is immersed; but will go no higher: for it is found, that a common pump will draw water no higher than 33 feet above the surface of the well; and unless the bucket goes within that distance from the well, the water will never get above it. Now, as it is the pressure of the atmosphere on the surface of the water in the well that causes the water to ascend in the pump, and follow the piston or bucket, when the air above it is lifted up; it is evident, that a column of water 33 feet high, is equal in weight to a column of quicksilver of the same diameter, 29½ inches high; and to as thick a column of air, reaching from the earth's surface to the top of the atmosphere.

In serene calm weather, the air has weight enough to support a column of quicksilver 31 inches high; but in tempestuous stormy weather, not above 28 inches. The quicksilver thus supported in a glass tube, is found to be a nice counterbalance to the weight or pressure of the air, and to shew its alterations at different times. And being now generally used to denote the changes in the weight of the air, and of the weather consequent upon them, it is called the *barometer* or *weather-glass*. See *BAROMETER*.

The pressure of the air being equal on all sides of a

body exposed to it, the softest bodies sustain this pressure without suffering any change in their figure; and so do the most brittle bodies without being broke.

## SECT. II. Experiments with the Air-pump, shewing the Resistance, Weight, and Elasticity of the Air.

Plate  
CCXLIII.  
fig. 8.

iii.  
The air-  
pump.

THE Air-pump being in effect the same as the water-pump, whoever understands the one will be at no loss to understand the other.

Having put a wet leather on the plate LL of the air-pump, place the glass-receiver M upon the leather, so that the hole *i* in the plate may be within the glass. Then turning the handle F backward and forward, the air will be pumped out of the receiver; which will then be held down to the plate by the pressure of the external air or atmosphere: for as the handle (fig. 9.) is turned backwards, it raises the piston *d e* in the barrel BK, by means of the wheel F and rack Dd; and as the piston is leathered so tight as to fit the barrel exactly, no air can get between the piston and barrel: and therefore all the air above *d* in the barrel is lifted up towards B, and a vacuum is made in the barrel from *e* to *b*; upon which, part of the air in the receiver M (fig. 8.), by its spring, rushes through the hole *i*, in the brass plate LL, along the pipe GCG, (which communicates with both barrels by the hollow trunk IHK (fig. 9.), and pushing up the valve *b*, enters into the vacant place *b e* of the barrel BK: for wherever the resistance or pressure is taken off, the air will run to that place, if it can find a passage.—Then as the handle F is turned forward, the piston *d e* will be depressed in the barrel; and as the air which had got into the barrel cannot be pushed back through the valve *b*, it will ascend through a hole in the piston, and escape through the valve at *d*, and be hindered by that valve from returning into the barrel when the piston is again raised. At the next raising of the piston, a vacuum is again made in the same manner as before, between *b* and *e*; upon which more of the air which was left in the receiver M, gets out thence by its spring, and runs into the barrel BK, through the valve B. The same thing is to be understood with regard to the other barrel AI; and as the handle F is turned backwards and forwards, it alternately raises and depresses the pistons in their barrels; always raising one whilst it depresses the other. And as there is a vacuum made in each barrel when its piston is raised, every particle of air in the receiver M pushes out another, by its spring or elasticity, through the hole *i*, and pipe GG, into the barrels; until at last the air in the receiver comes to be so much dilated, and its spring so far weakened, that it can no longer get thro' the valves; and then no more can be taken out. Hence there is no such thing as making a perfect vacuum in the receiver; for the quantity of air taken out at any one stroke, will always be as the density thereof in the receiver: and therefore it is impossible to take it all out; because, supposing the receiver and barrels of equal capacity, there will be always as much left as was taken out at the last turn of the handle.

There is a cock *k* below the pump-plate, which being turned, lets the air into the receiver again; and then the receiver becomes loose, and may be taken off the plate. The barrels are fixed to the frame Eee by two screw-nuts *ff*, which press down the top-piece E upon the barrels; and the hollow trunk H (in fig. 9.) is covered by a box, as GH in fig. 8.

There is a glass tube *lmnn* open at both ends, and about 34 inches long; the upper end communicating with the hole in the pump-plate, and the lower end immersed in quicksilver at *n* in the vessel N. To this tube is fitted a wooden ruler *mm*, called the *gage*, which is divided into inches and parts of an inch, from the bottom at *n*, (where it is even with the surface of the quicksilver), and continued up to the top, a little below *l*, to 30 or 31 inches.

As the air is pumped out of the receiver M, it is likewise pumped out of the glass tube *lmn*, because that tube opens into the receiver through the pump-plate; and as the tube is gradually emptied of air, the quicksilver in the vessel N is forced up into the tube by the pressure of the atmosphere. And if the receiver could be perfectly exhausted of air, the quicksilver would stand as high in the tube as it does at that time in the barometer: for it is supported by the same power or weight of the atmosphere in both (A).

The quantity of air exhausted out of the receiver on each turn of the handle, is always proportionable to the ascent of the quicksilver on that turn; and the quantity of air remaining in the receiver, is proportionable to the descent of the height of the quicksilver in the gage from what it is at that time in the barometer.

1. There is a little machine, consisting of two mills, *a* and *b*, which are of equal weights, independent of each other, and turn equally free on their axis in the frame. Each mill has four thin arms or sails fixed into the axis: those of the mill *a* have their planes at right angles to its axis; and those of *b* have their planes parallel to it. Therefore, as the mill *a* turns round in common air, it is but little resisted thereby, because its sails cut the air with their thin edges; but the mill *b* is much resisted, because the broad sides of its sails move against the air when it turns round. In each axle is a pin near the middle of the frame, which goes quite through the axle, and stands out a little on each side of it: upon these pins the slider *d* may be made to bear, and so hinder the mills from going, when the strong spring *c* is set on bend against the opposite ends of the pins.

Having set this machine upon the pump-plate LL, (fig. 8.) draw up the slider *d* to the pins on one side, and set the spring *c* at bend upon the opposite ends of the pins: then push down the slider *d*, and the spring acting equally strong upon each mill, will set them both a-going with equal forces and velocities: but the mill *a* will run much longer than the mill *b*, because the air makes much less resistance against the edges of its sails than against the sides of the sails of *b*.

Draw up the slider again, and set the spring upon the pins as before; then cover the machine with the receiver M (fig. 8.) upon the pump-plate; and having exhausted

(A) Such is the common construction. But there is another invented by Mr Smeaton; by which a purer vacuum is obtained, and which also acts as a condensing engine. There is, moreover, what they call a portable air-pump, which is placed on a table, and may be easily conveyed from one place to another. See the article (Air)-PUMP.

Experi-  
ments.

Experi-  
ments.

ed the receiver of air, push down the wire PP (thro' the collar of leathers in the neck *g*) upon the slider; which will disengage it from the pins, and allow the mills to turn round by the impulse of the spring: and as there is no air in the receiver to make any sensible resistance against them, they will both move a considerable time longer than they did in the open air; and the moment that one stops, the other will do so too.—This shows, that air resists bodies in motion; and that equal bodies meet with different degrees of resistance, according as they present greater or less surfaces to the air, in the planes of their motions.

2. Take off the receiver M and the mills; and having put the guinea *a* and feather *b* upon the brass flap *e*, turn up the flap, and shut it into the notch *d*. Then putting a wet leather over the top of the tall receiver AB (it being open both at top and bottom) cover it with the plate C, from which the guinea-and-feather tongs *e d* will then hang within the receiver. This done, pump the air out of the receiver, and then draw up the wire *f* a little, which by a square piece on its lower end will open the tongs *e d*; and the flap falling down as at *e*, the guinea and feather will descend with equal velocities in the receiver, and both will fall upon the pump-plate at the same instant. *N. B.* In this experiment, the observers ought not to look at the top, but at the bottom, of the receiver, in order to see the guinea and feather fall upon the plate; otherwise, on account of the quickness of their motion, they will escape the sight of the beholders.

To show the weight of the air.

1. Having fitted a brass cap, with a valve tied over it, to the mouth of a thin bottle or Florence flask, whose contents are exactly known, screw the neck of this cap into the hole *i* of the pump-plate; then having exhausted the air out of the flask, and taken it off from the pump, let it be suspended at one end of a balance, and nicely counterpoised by weights in the scale at the other end; this done, raise up the valve with a pin, and the air will rush into the flask with an audible noise: during which time, the flask will descend, and pull down that end of the beam. When the noise is over, put as many grains into the scale at the other end as will restore the equilibrium; and they will shew exactly the weight of the quantity of air which has got into the flask and filled it. If the flask holds an exact quart, it will be found, that 17 grains will restore the equipoise of the balance, when the quicksilver stands at 29½ inches in the barometer: which shows, that when the air is at a mean rate of density, a quart of it weighs 17 grains: it weighs more when the quicksilver stands higher, and less when it stands lower.

2. Place the small receiver O (fig. 8.) over the hole *i* in the pump-plate; and upon exhausting the air, the receiver will be fixed down to the plate by the pressure of the air on its outside, which is left to act alone, without any air in the receiver to act against it: and this pressure will be equal to as many times 15 pounds as there are square inches in that part of the plate which the receiver covers; which will hold down the receiver so fast, that it cannot be got off until the air be let into it by turning the cock *k*; and then it becomes loose.

Fig. 12.

3. Set the little glass AB (which is open at both

2

ends) over the hole *i* upon the pump-plate LL, and put your hand close upon the top of it at B: then, upon exhausting the air out of the glass, you will find your hand pressed down with a great weight upon it; so that you can hardly release it until the air be re-admitted into the glass by turning the cock *k*; which air, by acting as strongly upward against the hand as the external air acted in pressing it downward, will release the hand from its confinement.

4. Having tied a piece of wet bladder *b* over the open top of the glass A, (which is also open at bottom), set it to dry, and then the bladder will be tight like a drum. Then place the open end A upon the pump-plate over the hole *i*, and begin to exhaust the air out of the glass. As the air is exhausting, its spring in the glass will be weakened, and give way to the pressure of the outward air on the bladder; which, as it is pressed down, will put on a spherical concave figure, which will grow deeper and deeper, until the strength of the bladder be overcome by the weight of the air; and then it will break with a report as loud as that of a gun.—If a flat piece of glass be laid upon the open top of this receiver, and joined to it by a flat ring of wet leather between them, upon pumping the air out of the receiver, the pressure of the outward air upon the flat glass will break it all to pieces.

5. Immerse the neck *cd* of the hollow glass-ball *e b* Fig. 14. in water, contained in the phial *a a*; then set it upon the pump-plate, and cover it and the hole *i* with the close receiver A; and then begin to pump out the air. As the air goes out of the receiver by its spring, it will also by the same means go out of the hollow ball *e b*, through the neck *dc*, and rise up in bubbles to the surface of the water in the phial; from whence it will make its way, with the rest of the air in the receiver, through the air-pipe GG and valves *a* and *b*, into the open air. When it has done bubbling in the phial, the ball is sufficiently exhausted; and then, upon turning the cock *k*, the air will get into the receiver, and press so upon the surface of the water in the phial, as to force the water up into the ball in a jet, through the neck *cd*, and will fill the ball almost full of water. The reason why the ball is not quite filled, is because all the air could not be taken out of it; and the small quantity that was left in, and had expanded itself so as to fill the whole ball, is now condensed into the same state as the outward air, and remains in a small bubble at the top of the ball, and so keeps the water from filling that part of the ball.

6. Pour some quicksilver into the jar D, and set it Fig. 15. on the pump-plate near the hole *i*; then set on the tall open receiver AB, so as to be over the jar and hole; and cover the receiver with the brass-plate C. Screw the open glass tube *f g* (which has a brass top on it at *h*) into the syringe H; and putting the tube through a hole in the middle of the plate, so as to immerse the lower end of the tube *e* in the quicksilver at D, screw the end *h* of the syringe into the plate. This done, draw up the piston in the syringe by the ring I, which will make a vacuum in the syringe below the piston; and as the upper end of the tube opens into the syringe, the air will be diluted in the tube, because part of it by its spring gets up into the syringe; and the spring of the undiluted air in the receiver acting upon the surface of the quicksilver in the

35 E 2

jar,

jar, will force part of it up into the tube; for the quicksilver will follow the piston in the syringe, in the same way, and for the same reason, that water follows the piston of a common pump when it is raised in the pump-barrel; and this, according to some, is done by suction. But to refute that erroneous notion, let the air be pumped out of the receiver AB, and then all the quicksilver in the tube will fall down by its own weight into the jar, and cannot be again raised one hair's-breadth in the tube by working the syringe: which shows that suction had no hand in raising the quicksilver: and to prove that it is done by pressure, let the air into the receiver by the cock *k* (fig. 8.), and its action upon the surface of the quicksilver in the jar will raise it up into the tube, although the piston of the syringe continues motionless.—If the tube be about 32 or 33 inches high, the quicksilver will rise in it very near as high as it stands at that time in the barometer. And if the syringe has a small hole, as *m*, near the top of it, and the piston be drawn up above that hole, the air will rush through the hole into the syringe and tube, and the quicksilver will immediately fall down into the jar. If this part of the apparatus be air-tight, the quicksilver may be pumped up into the tube to the same height that it stands in the barometer; but it will go no higher, because then the weight of the column in the tube is the same as the weight of a column of air of the same thickness with the quicksilver, and reaching from the earth to the top of the atmosphere.

Fig. 16.

7. Having placed the jar A, with some quicksilver in it, on the pump-plate, as in the last experiment, cover it with the receiver B; then push the open end of the glass tube *d e* through the collar of leathers in the brass neck C (which it fits so as to be air-tight) almost down to the quicksilver in the jar. Then exhaust the air out of the receiver, and it will also come out of the tube, because the tube is close at top. When the gauge *mm* shews that the receiver is well exhausted, push down the tube so as to immerse its lower end into the quicksilver in the jar. Now, although the tube be exhausted of air, none of the quicksilver will rise into it, because there is no air left in the receiver to press upon its surface in the jar: but let the air into the receiver by the cock *k*, and the quicksilver will immediately rise in the tube, and stand as high in it as it was pumped up in the last experiment.

Both these experiments show, that the quicksilver is supported in the barometer by the pressure of the air on its surface in the box, in which the open end of the tube is placed: And that the more dense and heavy the air is, the higher does the quicksilver rise; and, on the contrary, the thinner and lighter the air is, the more will the quicksilver fall. For if the handle F be turned ever so little, it takes some air out of the receiver, by raising one or other of the pistons in its barrel; and consequently, that which remains in the receiver is so much the rarer, and has so much the less spring and weight; and thereupon the quicksilver falls a little in the tube: but upon turning the cock, and re-admitting the air into the receiver, it becomes as weighty as before, and the quicksilver rises again to the same height.—Thus we see the reason why the quicksilver in the barometer falls before rain or snow, and rises before fair weather; for, in the former case,

the air is too thin and light to bear up the vapours, and in the latter, too dense and heavy to let them fall.

[N.B. In all mercurial experiments with the air-pump, a short pipe must be screwed into the hole *i*, so as to rise about an inch above the plate, to prevent the quicksilver from getting into the air-pipe and barrels, in case any of it should be accidentally spilt over the jar: for if it once gets into the pipes or barrels, it spoils them, by loosening the solder, and corroding the brass.]

8. Take the tube out of the receiver, and put one end of a bit of dry hazel-branch, about an inch long, tight into the hole, and the other end tight into a hole quite through the bottom of a small wooden cup: then pour some quicksilver into the cup, and exhaust the receiver of air; and the pressure of the outward air on the surface of the quicksilver will force it through the pores of the hazel, from whence it will defend in a beautiful shower into a cup placed under the receiver to catch it.

9. Put a wire through the collar of leathers in the top of the receiver, and fit a bit of dry wood on the end of the wire within the receiver; then exhaust the air, and push the wire down, so as to immerse the wood into a jar of quicksilver on the pump-plate. This done, let in the air; and upon taking the wood out of the jar, and splitting it, its pores will be found full of quicksilver, which the force of the air, upon being let into the receiver, drove into the wood.

10. Join the two brass hemispherical cups A and B Fig. 17. together, with a wet leather between them, having a hole in the middle of it; then screw the end D of the pipe CD into the plate of the pump at *i*, and turn the cock E, so as the pipe may be open all the way into the cavity of the hemispheres: then exhaust the air out of them, and turn the cock a quarter round, which will shut the pipe CD, and keep out the air. This done, unscrew the pipe at D from the pump; and screw the piece F*h* upon it at D; and let two strong men try to pull the hemispheres asunder by the rings *g* and *h*, which they will find hard to do: for if the diameter of the hemispheres be four inches, they will be pressed together by the external air with a force equal to 188 pounds. And to shew that it is the pressure of the air that keeps them together, hang them by either of the rings upon the hook P of the wire in the receiver M (fig. 8.), and upon exhausting the air out of the receiver they will fall asunder of themselves.

11. Place a small receiver O (fig. 8.) near the hole *i* on the pump-plate, and cover both it and the hole with the receiver M; and turn the wire so by the top P, that its hook may take hold of the little receiver by a ring at its top, allowing that receiver to stand with its own weight on the plate. Then, upon working the pump, the air will come out of both receivers; but the large one M will be forcibly held down to the pump by the pressure of the external air; whilst the small one O, having no air to press upon it, will continue loose, and may be drawn up and let down at pleasure, by the wire PP. But, upon letting it quite down to the plate, and admitting the air into the receiver M, by the cock *k*, the air will press so strongly upon the small receiver O, as to fix it down to the plate; and at the same time, by counterbalancing the outward pressure on the large receiver M, it will become loose. This experiment

Experiments.

Experiments.

ment evidently shows, that the receivers are held down by pressure, and not by suction: for the internal receiver continued loose whilst the operator was pumping, and the external one was held down; but the former became fast immediately by letting in the air upon it.

Fig. 19.

12. Screw the end A of the brafs pipe ABF into the hole of the pump-plate, and turn the cock *e* until the pipe be open; then put a wet leather upon the plate *cd*, which is fixed on the pipe, and cover it with the tall receiver GH, which is close at top: then exhault the air out of the receiver, and turn the cock *e* to keep it out; which done, unscrew the pipe from the pump, and set its end A into a bafon of water, and turn the cock *e* to open the pipe; on which, as there is no air in the receiver, the pressure of the atmosphere on the water in the bafon will drive the water forcibly through the pipe, and make it play up in a jet to the top of the receiver.

13. Set the square phial A (fig. 21.) upon the pump-plate, and having covered it with the wire-cage B, put a close receiver over it, and exhault the air out of the receiver; in doing of which, the air will also make its way out of the phial through a small hole in its neck under the valve *b*. When the air is exhaulted, turn the cock below the plate, to re-admit the air into the receiver; and as it cannot get into the phial again because of the valve, the phial will be broken into some thousands of pieces by the pressure of the air upon it. Had the phial been of a round form, it would have sustained this pressure like an arch, without breaking; but as its sides are flat, it cannot.

vi.  
To show the  
elasticity or  
spring of the  
air.

14. Tie up a very small quantity of air in a bladder, and put it under a receiver; then exhault the air out of the receiver; and the small quantity which is confined in the bladder (having nothing to act against it) will expand itself so by the force of its spring, as to fill the bladder as full as it could be blown of common air. Bu. upon letting the air into the receiver again, it will overpower the air in the bladder, and press its sides almost close together.

15. If the bladder so tied up be put into a wooden box, and have 20 or 30 pounds weight of lead put upon it in the box, and the box be covered with a close receiver; upon exhaulting the air out of the receiver, that air which is confined in the bladder will expand itself so, as to raise up all the lead by the force of its spring.

Fig. 14.

16. Take the glafs ball mentioned in the fifth experiment, which was left full of water all but a small bubble of air at top; and having set it with its neck downward into the empty phial *aa*, and covered it with a close receiver, exhault the air out of the receiver; and the small bubble of air in the top of the ball will expand itself so as to force all the water out of the ball into the phial.

Fig. 18.

17. Screw the pipe AB into the pump-plate; place the tall receiver GH upon the plate *cd*, as in the 12th experiment; and exhault the air out of the receiver: then turn the cock *e* to keep out the air, unscrew the pipe from the pump, and screw it into the mouth of the copper vessel CC (fig. 22.), the vessel having first been about half filled with water. Then open the cock *e*, (fig. 18.) and the spring of the air which is confined in the copper vessel will force the water up through the pipe AB in a jet into the exhaulted receiver, as strong-

ly as it did by its pressure on the surface of the water in a bafon, in the 12th experiment.

18. If a fowl, a cat, rat, mouse, or bird, be put under a receiver, and the air be exhaulted, the animal will be at first oppressed as with a great weight, then grow convulsed, and at last expire in all the agonies of a most bitter and cruel death. But as this experiment is too shocking to every spectator who has the least degree of humanity, some substitute a machine called the *lungi-glafs* in place of the animal.

19. If a butterfly be suspended in a receiver by a fine thread tied to one of its horns, it will fly about in the receiver as long as the receiver continues full of air; but if the air be exhaulted, though the animal will not die, and will continue to flutter its wings, it cannot remove itself from the place where it hangs in the middle of the receiver until the air be let in again; and then the animal will fly about as before.

20. Pour some quicksilver into the small bottle A, Fig. 19; and screw the brafs collar *c* of the tube BC into the brafs neck *b* of the bottle, and the lower end of the tube will be immerfed into the quicksilver, so that the air above the quicksilver in the bottle will be confined there, because it cannot get out about the joinings, nor can it be drawn out through the quicksilver into the tube. This tube is also open at top, and is to be covered with the receiver G and large tube EF; which tube is fixed by brafs collars to the receiver, and is close at the top. This preparation being made, exhault the air both out of the receiver and its tube; and the air will by the same means be exhaulted out of the inner tube BC, through its open top at C; and as the receiver and tubes are exhaulting, the air that is confined in the glafs bottle A will press so by its spring upon the surface of the quicksilver, as to force it up in the inner tube as high as it was raised in the ninth experiment by the pressure of the atmosphere: which demonstrates, that the spring of the air is equivalent to its weight.

21. Screw the end C of the pipe CD into the hole of the pump-plate, and turn all the three cocks *d*, G, and H, so as to open the communications between all the three pipes E, F, DC, and the hollow trunk AB. Then cover the plates *g* and *h* with wet leathers, which have holes in their middle where the pipes open into the plates; and place the close receiver I upon the plate G: this done, shut the pipe F by turning the cock H, and exhault the air out of the receiver I. Then turn the cock *d* to shut out the air, unscrew the machine from the pump, and having screwed it to the wooden foot L, put the receiver K upon the plate *b*; this receiver will continue loose on the plate as long as it keeps full of air; which it will do until the cock H be turned to open the communication between the pipes F and E, through the trunk AB; and then the air in the receiver K, having nothing to act against its spring, will run from K into I, until it be so divided between these receivers as to be of equal density in both; and then they will be held down with equal forces to their plates by the pressure of the atmosphere, though each receiver will then be kept down but with one half of pressure upon it that the receiver I had when it was exhaulted of air; because it has now one half of the common air in it which filled the receiver K when it was set upon the plate; and therefore, a force equal to half

half the force of the spring of common air, will act within the receivers against the whole pressure of the common air upon their outsides. This is called *transferring the air out of one vessel into another*.

Fig. 21.

22. Put a cork into the square phial A, and fix it in with wax or cement; put the phial upon the pump-plate with the wire cage B over it, and cover the cage with a close receiver. Then exhaust the air out of the receiver; and the air that was corked up in the phial will break the phial outwards by the force of its spring, because there is no air left on the outside of the phial to act against the air within it.

23. Put a shrivelled apple under a close receiver, and exhaust the air; then the spring of the air within the apple will plump it out, so as to cause all the wrinkles disappear; but upon letting the air into the receiver again to press upon the apple, it will instantly return to its former decayed and shrivelled state.

24. Take a fresh egg, and cut off a little of the shell and film from its smallest end; then put the egg under a receiver, and pump out the air; upon which all the contents in the egg will be forced out into the receiver by the expansion of a small bubble of air contained in the great end between the shell and film.

25. Put some warm beer in a glass; and having set it on the pump, cover it with a close receiver, and then exhaust the air. Whilst this is doing, and thereby the pressure more and more taken off from the beer in the glass, the air therein will expand itself, and rise up in innumerable bubbles to the surface of the beer; and from thence it will be taken away with the other air in the receiver. When the receiver is nearly exhausted, the air in the beer, which could not disentangle itself quick enough to get off with the rest, will now expand itself so, as to cause the beer to have all the appearance of boiling; and the greatest part of it will go over the glass.

26. Put some warm water in a glass, and put a bit of dry waincoat or other wood into the water. Then cover the glass with a close receiver, and exhaust the air; upon which the air in the wood, having liberty to expand itself, will come out plentifully, and make all the water to bubble about the wood, especially about the ends, because the pores lie lengthwise. A cubic inch of dry waincoat has so much air in it, that it will continue bubbling for near half an hour together.

vii.  
Miscellaneous  
experiments.

27. Screw the syringe H (fig. 15.) to a piece of lead that weighs one pound at least; and holding the lead in one hand, pull up the piston in the syringe with the other; then quitting hold of the lead, the air will push it upward, and drive back the syringe upon the piston. The reason of this is, that the drawing up of the piston makes a vacuum in the syringe; and the air, which presses every way equally, having nothing to resist its pressure upward, the lead is thereby pressed upward contrary to its natural tendency by gravity. If the syringe so loaded be hung in a receiver, and the air be exhausted, the syringe and lead will descend upon the piston-rod by their natural gravity; and upon admitting the air into the receiver, they will be drove upward again until the piston be at the very bottom of the syringe.

28. Let a large piece of cork be suspended by a thread at one end of a balance, and counterpoised by a leaden

weight, suspended in the same manner, at the other. Let this balance be hung to the inside of the top of a large receiver; which being set on the pump, and the air exhausted, the cork will preponderate, and show itself to be heavier than the lead; but upon letting in the air again, the equilibrium will be restored. The reason of this is, that since the air is a fluid, and all bodies lose as much of their absolute weight in it as is equal to the weight of their bulk of the fluid, the cork being the larger body, loses more of its real weight than the lead does; and therefore must in fact be heavier, to balance it under the disadvantage of losing some of its weight: which disadvantage being taken off by removing the air, the bodies then gravitate according to their real quantities of matter, and the cork, which balanced the lead in air, shows itself to be heavier when *in vacuo*.

29. Set a lighted candle upon the pump, and cover it with a tall receiver. If the receiver holds a gallon, the candle will burn a minute; and then, after having gradually decayed from the first instant, it will go out: which shews, that a constant supply of fresh air is necessary to feed flame; and so it also is for animal-life. For a bird kept under a close receiver will soon die, although no air be pumped out; and it is found that, in the diving-bell, a gallon of air is sufficient only for one minute for a man to breathe in.

The moment when the candle goes out, the smoke will be seen to ascend to the top of the receiver, and there it will form a sort of cloud: but upon exhausting the air, the smoke will fall down to the bottom of the receiver, and leave it as clear at the top as it was before it was set upon the pump. This shews, that smoke does not ascend on account of its being positively light, but because it is lighter than air; and its falling to the bottom when the air was taken away, shews that it is not destitute of weight. So moist forts wood ascend or swim in water; and yet there are none who doubt of the wood's having gravity or weight.

30. Set a receiver, which is open at top, upon the air-pump, and cover it with a brass plate and wet leather; and having exhausted it of air, let the air in again at top through an iron pipe, making it pass thro' a charcoal flame at the end of the pipe; and when the receiver is full of that air, lift up the cover and let down a mouse or bird into the receiver, and the burnt air will immediately kill it. If a candle be let down into the air, it will go out directly; but by letting it down gently, it will purify the air so far as it goes; and so, by letting it down more and more, all the air in the receiver will be purified.

31. Set a bell upon a cushion on the pump-plate, and cover it with a receiver; then shake the pump to make the clapper strike against the bell, and the sound will be very well heard: but exhaust the receiver of air, and then, if the clapper be made to strike ever so hard against the bell, it will make no sound at all; which shews that air is absolutely necessary for the propagation of sound.

32. Let a candle be placed on one side of a receiver, and viewed through the receiver at some distance; then, as soon as the air begins to be exhausted, the receiver will be filled with vapours which rise from the wet leather, by the spring of the air in it; and the light of the candle being refracted through that medium of vapours,

Experiments.

vapours, will have the appearance of circles of various colours, of a faint resemblance to those in the rain-bow.

THE elastic air which is contained in many bodies, and is kept in them by the weight of the atmosphere, may be got out of them either by boiling, or by the air-pump, as shewn in the 25th experiment: but the fixed air, which is by much the greater quantity, cannot be got out but by distillation, fermentation, or putrefaction.

If fixed air did not come out of bodies with difficulty, and spend some time in extricating itself from them, it would tear them to pieces. Trees would be rent by the change of air from a fixed to an elastic state, and animals would be burst in pieces by the explosion of air in their food.

Dr Hales found by experiment, that the air in apples is so much condensed, that if it were let out into the common air, it would fill a space 48 times as great as the bulk of the apples themselves; so that its pressure outwards was equal to 11,776 lb. and, in a cubic inch of oak, to 19,860 lb. against its sides. So that if the air was let loose at once in these substances, they would

tear every thing to pieces about them with a force superior to that of gunpowder. Hence, in eating apples, it is well that they part with the air by degrees as they are chewed and ferment in the stomach, otherwise an apple would be immediate death to him who eats it.

The mixing of some substances with others will release the air from them, all of a sudden; which may be attended with very great danger. Of this we have a remarkable instance in an experiment made by Dr Slare; who having put half a dram of oil of carraway-seeds into one glass, and a dram of compound spirit of nitre in another, covered them both on the air-pump with a receiver six inches wide and eight inches deep, and then exhausted the air, and continued pumping until all that could possibly be got both out of the receiver, and out of the two fluids, was extricated: then, by a particular contrivance from the top of the receiver, he mixed the fluids together; upon which they produced such a prodigious quantity of air as instantly blew up the receiver, although it was pressed down by the atmosphere with upwards of 400 pound weight.

## P O C

Pneumonics.

PNEUMONICS, in pharmacy, medicines proper in diseases of the lungs, in which respiration is affected.

PO, a large and celebrated river of Italy, which has its source at mount Visi in Piedmont, and on the confines of Dauphiny. It runs through Piedmont, Monterrat, the Milanese, and duchy of Mantua; from thence it runs to the borders of the Parmezan, and a part of the Modenese; and having entered the Ferrarese, it begins to divide at Ficheruolo, and proceeds to discharge itself into the gulf of Venice by four principal mouths. As it passes along, it receives several rivers, and often overflows its banks, doing a great deal of mischief; the reason of which is, that most of those rivers descend from the Alps, and are increased by the melting of the snow.

POA, MEADOW-GRASS; a genus of the digynia order, belonging to the pentandria class of plants. There are 20 species; most of them grasses, and very agreeable food for cattle; for one species which grows in marshes, the cattle will frequently go so deep as to endanger their lives. This is called the *aquatica*, or *water reed-grass*. It is the largest of the British grasses, growing to the height of five or six feet. The leaves are smooth, and half an inch wide, or more. The panicle is eight or ten inches long, greatly branched, and decked with numerous spicula: these are of a reddish-brown colour intermixed with green, of a compressed lanceolate form, imbricated with about six flowers for the most part, but varying from five to ten.

POCOCK (Dr Edward), one of the most learned men in the oriental tongues in Europe, was the eldest son of the Rev. Mr Edward Pocock; and was born at Oxford in 1604, where he was also bred. In 1628, he was admitted probationer fellow of his college, and about the same time had prepared an edition of the Second Epistle of St Peter, the Second and Third of St John, and that of St Jude, in Syriac and Greek,

## P O C

Pocock.

with a Latin Translation and Notes. In 1629, he was ordained priest, and appointed chaplain to the English merchants at Aleppo, where he continued five or six years; in which time he distinguished himself by his fortitude and zeal while the plague raged there. At length returning to England, he was, in 1636, appointed reader of the Arabic lectures founded by archbishop Laud. Three years after, he went to Constantinople, where he prosecuted his studies of the Eastern tongues, and procured many valuable manuscripts. After near four years stay in that city, he embarked in 1640; and taking Paris in his way, visited Gabriel Sionita the famous Maronite, and Hugo Grotius. In 1643, he was presented to the rectory of Chilton in Berks; and, about three years after, married the daughter of Thomas Burdett, Esq. About the middle of 1647, he obtained the restitution of the salary of his Arabic lecture, which had been detained from him about three years. In 1648, king Charles I. who was then prisoner in the Isle of Wight, nominated Mr Pocock to the professorship of Hebrew, and the canonry of Christ-church annexed to it; but, in 1650, he was ejected from his canonry for refusing to take the engagement, and soon after a vote passed for depriving him of his Hebrew and Arabic lectures; but several governors of houses, &c. presenting a petition in his favour, he was suffered to enjoy both those places. He had some years before published his *Specimen Historiæ Arabum*; and now appeared his *Porta Mosis*; and soon after, the English Polyglot edition of the Bible, to which he had largely contributed, and also Euty chius's Annals, with a Latin version. At the Restoration, he was restored to the canonry of Christ-church, and also received the degree of doctor of divinity. He then published his Arabic Version of Grotius's Treatise of the Truth of the Christian Religion; and an Arabic Poem, intitled *Lamiat' Ajam*, with a Latin Translation and Notes. Soon after, he published Gregory Abul Pharajius's *Historia Dynastiarum*.

Podolia  
||  
Poestum.

*tium*. In 1674, he published an Arabic Version of the chief parts of the Liturgy of the church of England; and a few years after his Commentary on the Prophecies of Micah, Malachi, Hosea, and Joel. This great man died in 1691, after having been for many years confessedly the first person in Europe for eastern learning; and was no less worthy of admiration for his uncommon modesty and humility, and all the virtues that can adorn a Christian. His theological works were republished at London in 1740, in two volumes in folio.

PODOLIA, a province of Poland, bounded on the east by Volhnia and the river Ukraïn; on the north and north-east, by Budziac Tartary; on the south-east, by the river Niester, which separates it from Bessarabia and Moldavia in European Turkey on the south-west; and by the province of Red Russia, on the north-west. It is usually divided into the Upper and Lower: in the Upper, which is the western part, the chief town is Kamieck, the capital of Podolia, and of a palatinate. In the Lower, or eastern part of Podolia, the chief town is Brackow, the capital of a palatinate.

PODEX, in anatomy. The same with ANUS.

POEM, a poetical composition. See POETRY.

POESTUM, or POSIDONIA, an ancient city of Grecia Magna, now part of the kingdom of Naples. It has long since been in ruins, and these ruins only became known in the following manner, according to the account published by the author of the *Antiquities, History, and views, of Poestum*. "In the year 1755, an apprentice to a painter at Naples, who was on a visit to his friends at Capaccio, by accident took a walk to the mountains which surround the territory of Poestum. The only habitation he perceived was the cottage of a farmer, who cultivated the best part of the ground, and reserved the rest for pasture. The ruins of the ancient city made a part of this view, and particularly struck the eyes of the young painter; who, approaching nearer, saw with astonishment walls, towers, gates, and temples. Upon his return to Capaccio, he consulted the neighbouring people about the origin of these monuments of antiquity. He could only learn, that this part of the country had been uncultivated and abandoned during their memory; that about ten years before, the farmer, whose habitation he had noticed, established himself there; and that having dug in many places and searched among the ruins that lay round him, he had found treasures sufficient to enable him to purchase the whole. At the painter's return to Naples, he informed his master of these particulars, whose curiosity was so greatly excited by the description, that he took a journey to the place, and made drawings of the principal views. These were shown to the king of Naples, who ordered the ruins to be cleared, and Poestum arose from the obscurity in which it had remained for upwards of 700 years, as little known to the neighbouring inhabitants as to travellers."

Our author gives the following description of it in its present state. It is, says he, of an oblong figure, about two miles and a half in circumference. It has

four gates which are opposite to each other. On the key-stone of the arch of the north-gate, on the outside, is the figure of Neptune in basso relievo, and within a hippocampus. The walls which still remain are composed of very large cubical stones, and are extremely thick, in some parts 18 feet. That the walls have remained unto this time, is owing to the very exact manner in which the stones are fitted to one another, (a circumstance observed universally in the masonry of the ancients), and perhaps, in some measure, to a stasical concretion which has grown over them. On the walls here and there are placed towers of different heights, those near the gates being much higher and larger than the others, and evidently of modern workmanship. He observes, that, from its situation among marches, bituminous and sulphureous springs, Poestum must have been unwholesome; a circumstance mentioned by Strabo, *Morbosam eam facit fluvius in paludes diffusus*. In such a situation the water must have been bad. Hence the inhabitants were obliged to convey that necessary of life from purer springs by means of aqueducts, of which many vestiges still remain.

The principal monuments of antiquity are a theatre, an amphitheatre, and three temples. The theatres and amphitheatres are much ruined. The first temple is hexastylus, and amphiprotylos. At one end, the pillars and two columns which divided the cella from the pronaos are still remaining. Within the cella are two rows of smaller columns, with an architrave, which support the second order. This temple he takes to be of that kind called by Vitruvius *hypæthros*, and supports his opinion by a quotation from that author. The second temple is also amphiprotylos: it has nine columns in front and 18 in flank, and seems to be of that kind called by Vitruvius *pseudodipteros*. The third is likewise amphiprotylos. It has six columns in front and 13 in flank. Vitruvius calls this kind of temple *peripteros*. "The columns of these temples (says our author), are of that kind of Doric order which we find employed in works of the greatest antiquity. They are hardly five diameters in height. They are without bases, which also has been urged as a proof of their antiquity; but we do not find that the ancients ever used bases to this order, at least till very late. Vitruvius makes no mention of bases for this order: and the only instance we have of it, is in the first order of the coliseum at Rome, which was built by Vespasian. The pillars of these temples are fluted with very shallow flutings in the manner described by Vitruvius. The columns diminish from the bottom, which was the most ancient method almost universally in all the orders. The columns have atragals of a very singular form; which shows the error of those who imagine that this member was first invented with the Ionic order, to which the Greeks gave an atragal, and that the Romans were the first who applied it to the Doric. The echinus of the capital is of the same form with that of the temple of Corinth described by Le Roy."

## P O E T R Y.

<sup>1</sup> **A**MIDST those thick clouds which envelope the first ages of the world, reason and history throw some lights on the origin and primitive employment of this divine art. Reason suggests, that before the invention of letters, all the people of the earth had no other method of transmitting to their descendants the principles of their worship, their religious ceremonies, their laws, and the renowned actions of their sages and heroes, than by poetry; which included all these objects in a kind of hymns that fathers sung to their children, in order to engrave them with indelible strokes in their hearts. History not only informs us, that Moses and Miriam, the first authors that are known to mankind, sung, on the borders of the Red Sea, a song of divine praise, to celebrate the deliverance which the Almighty had vouchsafed to the people of Israel, by opening a passage to them through the waters; but it has also transmitted to us the song itself, which is at once the most ancient monument and a master-piece of poetic composition.

2. The Greeks, a people the most ingenious, the most animated, and in every sense the most accomplished, that the world ever produced—strove to ravish from the Hebrews the precious gift of poetry, which was vouchsafed them by the Supreme Author of all nature, that they might ascribe it to their false deities. According to their ingenious fictions, Apollo became the god of poetry, and dwelt on the hills of Phocis, Parnassus, and Helicon, whose feet were washed by the waters of Hyppocrene, of which each mortal that ever drank was seized with a sacred delirium. The immortal swans floated on its waves. Apollo was accompanied by the Muses—those nine learned sisters—the daughters of Memory: and he was constantly attended by the Graces. Pegasus, his winged courser, transported him with a rapid flight into all the regions of the universe. Happy emblems! by which we at this day embellish our poetry, as no one has ever yet been able to invent more brilliant images.

3. The literary annals of all nations afford vestiges of poetry, from the remotest ages. They are found among the most savage of the ancient barbarians, and the most desolate of all the Americans. Nature asserts her rights in every country, and every age. Tacitus mentions the verses and the hymns of the Germans, at the time when that rough people yet inhabited the woods, and while their manners were still savage. The first inhabitants of Runnia, and the other northern countries, those of Gaul, Albion, Iberia, Ausonia, and other nations of Europe, had their poetry, as well as the ancient people of Asia, and of the known borders of Africa. But the simple productions of nature have constantly something unformed, rough, and savage. The Divine Wisdom appears to have placed the ingenious and polished part of mankind on the earth, in order to refine that which comes from her bosom rude and imperfect: and thus art has polished poetry, which issued quite naked and savage from the brains of the first of mankind.

4. But what is Poetry? It would be to abridge the  
VOL. VIII.

limits of the poetic empire, to contract the sphere of this divine art, should we say, in imitation of all the dictionaries and other treatises on versification, *That poetry is the art of making verses, of lines or periods: that are in rhyme or metre.* This is rather a grammatical explanation of the word, than a real definition of the thing, and it would be to degrade poetry thus to define it. The justest definition seems to be that given by Baron Biersfeld †, *That poetry is the art of expressing our thoughts by fiction.* In fact, it is after this manner (if we reflect with attention) that all the metaphors and allegories, all the various kinds of fiction, form the first materials of a poetic edifice: it is thus that all images, all comparisons, illusions, and figures, especially those which personify moral subjects, as virtues and vices, concur to the decorating of such a structure. A work, therefore, that is filled with invention, that incessantly presents images which render the reader attentive and affected, where the author gives interesting sentiments to every thing that he makes speak, and where he makes speak by sensible figures all those objects which would affect the mind but weakly when clothed in a simple prosaic style, such a work is a poem. While that, though it be in verse, which is of a didactic, dogmatic, or moral nature, and where the objects are presented in a manner quite simple, without fiction, without images or ornaments, cannot be called *poetry*, but merely a work in verse; for the art of reducing thoughts, maxims, and periods, into ryme or metre, is very different from the art of poetry.

6. A ingenious fable, a lively and interesting romance, a comedy, the sublime narrative of the actions of a hero, such as the Telemachus of M. Fenelon, though written in prose, but in measured prose, is therefore a work of poetry: because the foundation and the superstructure are the productions of genius, as the whole proceeds from fiction; and truth itself appears to have employed an innocent and agreeable deception to instruct with efficacy. This is so true, that the pencil also, in order to please and affect, has recourse to fiction; and this part of painting is called the *poetic composition of a picture*. It is therefore by the aid of fiction that poetry, so to speak, paints its expressions, that it gives a body and a mind to its thoughts, that it animates and exalts that which would otherwise have remained arid and insensible. Every work, therefore, where the thoughts are expressed by fictions or images, is poetic; and every work where they are expressed naturally, simply, and without ornament, although it be in verse, is prosaic.

7. Verse, however, is not to be regarded as foreign or superfluous to poetry. To reduce those images, those fictions, into verse, is one of the greatest difficulties in poetry, and one of the greatest merits in a poem: and for these reasons, the cadence, the harmony of sounds, particularly that of rhyme, delight the ear to a high degree, and the mind insensibly repeats them while the eye reads them. There results therefore a

pleasure to the mind, and a strong attachment to these ornaments: but this pleasure would be frivolous, and even childish, if it were not attended by a real utility. Verses were invented in the first ages of the world, merely to aid and to strengthen the memory: for cadence, harmony, and especially rhyme, afford the greatest assistance to the memory that art can invent; and the images, or poetic fictions, that strike our senses, assist in graving them with such deep traces in our minds, as even time itself frequently cannot efface. How many ex-

cellent apophthegms, sentences, maxims, and precepts, would have been buried in the abyss of oblivion, if poetry had not preserved them by its harmony? To give more efficacy to this lively impression, the first poets sung their verses, and the words and phrases must necessarily have been reduced, at least to cadence, or they could not have been susceptible of musical expression. One of the great excellencies, therefore, though not a necessary constituent, of poetry, consists in its being expressed in verse. See Part III.

## PART I. GENERAL PRINCIPLES OF THE ART.

### SECT. I. Of the Essence and End of Poetry.

8. **U**NDER the article *Polite Arts*, it was observed, that the *essence* of these in general, and consequently of poetry in particular, consists in *expression*: and we think, that, to be poetic, the expression must necessarily arise from *fiction*, or invention \*. This invention, which is the fruit of happy genius alone, arises, 1. From the subject itself of which we undertake to treat: 2. From the manner in which we treat that subject, or the species of writing of which we make use: 3. From the plan that we propose to follow in conformity to this manner; and, 4. From the method of executing this plan in its full detail. Our first guides, the ancients, afford us no lights that can elucidate all these objects in general. The precepts which Aristotle lays down, relate to epic and dramatic poetry only: and which, by the way, confirms our idea, that antiquity itself made the essence of poetry to consist in fiction, and not in that species of verse which is destitute of it, or in that which is not capable of it. But since this art has arrived to a great degree of perfection; and as poetry, like electricity, communicates its fire to every thing it touches, and animates and embellishes whatever it treats; there seems to be no subject in the universe to which poetry cannot be applied, and that it cannot render equally brilliant and pleasing. From this universality of poetry, from its peculiar property of expression by fiction, which is applicable to all subjects, have arisen its different species, of which a particular description will be given in the *second part*.

9. Horace, in a well-known verse, has been supposed to declare the *end* of poetry to be twofold, to please, or to instruct:

*Aut prodesse volunt, aut delectare poete.*

But Dr Beattie † maintains, that the ultimate end of this art is to please; instruction being only one of the means (and not always a necessary one) by which that ultimate end is to be accomplished. The passage, rightly understood, he observes, will not appear to contain any thing inconsistent with this doctrine. The author is there stating a comparison between the Greek and Roman writers, with a view to the poetry of the stage; and, after commending the former for their correctness, and for the liberal spirit wherewith they conducted their literary labours, and blaming his countrymen for their inaccuracy and avarice, he proceeds thus: "The ends proposed by our dramatic poets (or by poets in general) are, to please, to instruct, or to do both. When instruction is your aim,

let your moral sentences be expressed with brevity, that they may be readily understood, and long remembered: where you mean to please, let your fictions be conformable to truth, or probability. The elder part of your audience (or readers) have no relish for poems that give pleasure only without instruction; nor the younger for short writings as give instruction without pleasure. He only can secure the universal suffrage in his favour, who blends the useful with the agreeable, and delights at the same time that he instructs the reader. Such are the works that bring money to the bookseller, that pass into foreign countries, and perpetuate the author's name thro' a long succession of ages ‡.—Now, what is the meaning of all this? What, but that to the *perfection* of dramatic poetry (or, if you please, of poetry in general) both sound morals and beautiful fiction are requisite? But Horace never meant to say, that instruction, as well as pleasure, is necessary to give to any composition the *poetical character*: or he would not in another place have celebrated, with so much affection and rapture, the melting strains of Sappho, and the playful genius of Anacreon §,—two authors transcendently sweet, but not remarkably instructive. We are sure, that pathos, and harmony, and elevated language, were, in Horace's opinion, essential to poetry §; and of these decorations nobody will affirm that instruction is the end, who considers that the most instructive books in the world are written in plain prose.

In short, our author has endeavoured by many ingenious arguments and illustrations to establish it as a truth in criticism, that the end of poetry is to *please*. Verses, if pleasing, may be poetical, though they convey little or no instruction; but verses, whose sole merit it is that they convey instruction, are not poetical. Instruction, however, he admits, especially in poems of length, is necessary to their *perfection*, because they would not be *perfectly agreeable* without it.

### SECT. II. Of the Standard of Poetical Invention.

10. HOMER's beautiful description of the heavens and earth, as they appear in a calm evening by the light of the moon and stars, concludes with this circumstance, "And the heart of the shepherd is glad \*." † *Iliad*, b. 8. v. 555. Madame Dacier, from the turn she gives to the passage in her version, seems to think, and Pope, in order perhaps to make out his couplet, insinuates, that the gladness of the shepherd is owing to his sense of the utility of those luminaries. And this may in part

be the case: but this is not in Homer; nor is it a necessary consideration. It is true, that, in contemplating the material universe, they who discern the causes and effects of things must be more rapturously entertained, than those who perceive nothing but shape and size, colour and motion. Yet, in the mere outside of nature's works, there is a splendor and a magnificence to which even untutored minds cannot attend, without great delight.

Not that all peasants, or all philosophers, are equally susceptible of these charming impressions. It is strange to observe the callousness of some men, before whom all the glories of heaven and earth pass in daily succession, without touching their hearts, elevating their fancy, or leaving any durable remembrance. Even of those who pretend to sensibility, how many are there to whom the lustre of the rising or setting sun; the sparkling concave of the midnight-sky; the mountain-forest tossing and roaring to the storm, or warbling with all the melodies of a summer evening; the sweet interchange of hill and dale, shade and sunshine, grove, lawn, and water, which an extensive landscape offers to the view; the scenery of the ocean, so lovely, so majestic, and so tremendous; and the many pleasing varieties of the animal and vegetable kingdom, could never afford so much real satisfaction, as the steams and noise of a ball-room, the insipid fiddling and squeaking of an opera, or the vexations and wranglings of a card-table!

But some minds there are of a different make; who, even in the early part of life, receive from the contemplation of Nature a species of delight which they would hardly exchange for any other; and who, as avarice and ambition are not the infirmities of that period, would, with equal sincerity and rapture, exclaim,

I care not, Fortune, what you me deny;  
You cannot rob me of free Nature's grace;  
You cannot shut the windows of the sky,  
Through which Aurora shows her brightening face;  
You cannot bar my constant feet to trace  
The woods and lawns by living stream at eve.

*Castle of Indolence.*

Such minds have always in them the seeds of true taste, and frequently of imitative genius. At least, tho' their enthusiastic or visionary turn of mind (as the man of the world would call it) should not always incline them to practise poetry or painting, we need not scruple to affirm, that without some portion of this enthusiasm no person ever became a true poet or painter. For he who would imitate the works of Nature, must first accurately observe them; and accurate observation is to be expected from those only who take great pleasure in it.

To a mind thus disposed no part of creation is indifferent. In the crowded city, and howling wilderness; in the cultivated province, and solitary isle; in the flowery lawn, and craggy mountain; in the murmur of the rivulet, and in the uproar of the ocean; in the radiance of summer, and gloom of winter; in the thunder of heaven, and in the whisper of the breeze; he still finds something to rouse or to soothe his imagination, to draw forth his affections, or to employ his understanding. And from every mental energy that is

not attended with pain, and even from some of those that are, as moderate terror and pity, a sound mind derives satisfaction; exercise being equally necessary to the body and the soul, and to both equally productive of health and pleasure.

This happy sensibility to the beauties of Nature should be cherished in young persons. It engages them to contemplate the Creator in his wonderful works; it purifies and harmonizes the soul, and prepares it for moral and intellectual discipline; it supplies an endless source of amusement; it contributes even to bodily health: and, as a strict analogy subsists between material and moral beauty, it leads the heart by an easy transition from the one to the other; and thus recommends virtue for its transcendent loveliness, and makes vice appear the object of contempt and abomination. An intimate acquaintance with the best descriptive poets, Spenser, Milton, and Thomson, but above all with the divine Georgic, joined to some practice in the art of drawing, will promote this amiable sensibility in early years: for then the face of Nature has novelty superadded to its other charms, the passions are not pre-engaged, the heart is free from care, and the imagination warm and romantic.

But, not to insist longer on those ardent emotions that are peculiar to the enthusiastic disciple of Nature, may it not be affirmed of all men, without exception, or at least of all the enlightened part of mankind, that they are gratified by the contemplation of things natural, as opposed to unnatural? Monstrous sights please but for a moment, if they please at all; for they derive their charm from the beholder's amazement, which is quickly over. We read indeed of a man of rank in Sicily†, who chooses to adorn his villa

† *Brydane's Tour in Sicily, let. 24.*

but it is a singular instance; and one would not be much more surprised to hear of a person living without food, or growing fat by the use of poison. To say of any thing, that it is *contrary to nature*, denotes censure and disgust on the part of the speaker; as the epithet *natural* intimates an agreeable quality, and seems for the most part to imply, that a thing is as it ought to be, suitable to our own taste, and congenial with our own constitution. Think, with what sentiments we should peruse a poem, in which Nature was totally misrepresented, and principles of thought and of operation supposed to take place, repugnant to every thing we had seen or heard of:—in which, for example, avarice and coldness were ascribed to youth, and prodigality and passionate attachment to the old; in which men were made to act at random, sometimes according to character, and sometimes contrary to it; in which cruelty and envy were productive of love, and beneficence and kind affection of hatred; in which beauty was invariably the object of dislike, and ugliness of desire; in which society was rendered happy by atheism and the promiscuous perpetration of crimes, and justice and fortitude were held in universal contempt. Or think, how we should relish a painting, where no regard was had to the proportions, colours, or any of the physical laws, of Nature:—where the ears and eyes of animals were placed in their shoulders; where the sky was green, and the grass crimson; where trees grew with their branches in the earth, and their roots in the air; where men

were seen fighting after their heads were cut off, ships sailing on the land, lions entangled in cobwebs, sheep preying on dead carcases, fishes sporting in the woods, and elephants walking on the sea. Could such figures and combinations give pleasure, or merit the appellation of sublime or beautiful? Should we hesitate to pronounce their author mad? And are the absurdities of madmen proper subjects either of amusement or of imitation to reasonable beings?

Let it be remarked too, that though we distinguish our internal powers by different names, because otherwise we could not speak of them so as to be understood, they are all but so many energies of the same individual mind; and therefore it is not to be supposed, that what contradicts any one leading faculty should yield permanent delight to the rest. That cannot be agreeable to reason, which conscience disapproves; nor can that gratify imagination, which is repugnant to reason.—Besides, belief and acquiescence of mind are pleasant, as distrust and disbelief are painful: and therefore, that only can give solid and general satisfaction, which has something of plausibility in it; something which we conceive it possible for a rational being to believe. But no rational being can acquiesce in what is obviously contrary to nature, or implies palpable absurdity.

Poetry, therefore, and indeed every art whose end is to please, must be natural; and if so, must exhibit real matter of fact, or something like it; that is, in other words, must be, either according to truth, or according to verisimilitude.

And though every part of the material universe abounds in objects of pleasurable contemplation, yet nothing in nature so powerfully touches our hearts, or gives so great variety of exercise to our moral and intellectual faculties, as man. Human affairs and human feelings are universally interesting. There are many who have no great relish for the poetry that delineates only irrational or inanimate beings; but to that which exhibits the fortunes, the characters, and the conduct of men, there is hardly any person who does not listen with sympathy and delight. And hence, to imitate human action, is considered by Aristotle as essential to this art; and must be allowed to be essential to the most pleasing and most instructive part of it, Epic and Dramatic composition. Mere descriptions, however beautiful, and moral reflections, however just, become tiresome, where our passions are not occasionally awakened by some event that concerns our fellow-men. Do not all readers of taste receive peculiar pleasure from those little tales or episodes with which Thomson's descriptive poem on the Seasons is here and there enlivened? and are they not sensible, that the thunder-storm would not have been half so interesting without the tale of the two lovers, (*Summ.* v. 1171); nor the harvest-scene, without that of Palemon and Lavinia, (*Aut.* v. 177.); nor the driving snows, without that exquisite picture of a man perishing among them, (*Winter.* v. 276.)? It is much to be regretted, that Young did not employ the same artifice to animate his Night-Thoughts. Sentiments and descriptions may be regarded as the pilasters, carvings, gildings, and other decorations of the poetical fabric; but human actions are the columns and the rafters, that give it stability and elevation. Or,

changing the metaphor, we may consider these as the soul which informs the lovely frame; while those are little more than the ornaments of the body.

Whether the pleasure we take in things natural, and our dislike to what is the reverse, be the effect of habit or of constitution, is not a material inquiry. There is nothing absurd in supposing, that between the soul, in its first formation, and the rest of nature, a mutual harmony and sympathy may have been established, which experience may indeed confirm, but no perverse habits could entirely subdue. As no sort of education could make man believe the contrary of a self-evident axiom, or reconcile him to a life of perfect solitude; so we should imagine, that our love of nature and regularity might still remain with us in some degree, though we had been born and bred in the Sicilian villa above-mentioned, and never heard any thing applauded but what deserved censure, nor censured but what merited applause. Yet habit must be allowed to have a powerful influence over the sentiments and feelings of mankind. Objects to which we have been long accustomed, we are apt to contract a fondness for; we conceive them readily, and contemplate them with pleasure; nor do we quit our old tracts of speculation or practice, without reluctance and pain. Hence in part arises our attachment to our own professions, our old acquaintance, our native soil, our homes, and to the very hills, streams, and rocks in our neighbourhood. It would therefore be strange, if man, accustomed as he is from his earliest days to the regularity of nature, did not contract a liking to her productions, and principles of operation.

Yet we neither expect nor desire, that every human invention, where the end is only to please, should be an exact transcript of real existence. It is enough, that the mind acquiesce in it as probable, or plausible, or such as we think might happen without any direct opposition to the laws of Nature:—Or, to speak more accurately, it is enough, that it be consistent, either, first, with general experience; or, secondly, with popular opinion; or, thirdly, that it be consistent with itself, and connected with probable circumstances.

First: If a human invention be consistent with general experience, we acquiesce in it as sufficiently probable. Particular experiences, however, there may be, so uncommon and so little expected, that we should not admit their probability, if we did not know them to be true. No man of sense believes, that he has any likelihood of being enriched by the discovery of hidden treasure; or thinks it probable, on purchasing a lottery-ticket, that he shall gain the first prize; and yet great wealth has actually been acquired by such good fortune. But we should look upon these as poor expedients in a play or romance for bringing about a happy catastrophe. We expect that fiction should be more consonant to the general tenor of human affairs; in a word, that not possibility, but probability, should be the standard of poetical invention.

Secondly: Fiction is admitted as conformable to this standard, when it accords with received opinions. These may be erroneous, but are not often apparently repugnant to nature. On this account, and because they are familiar to us from our infancy, the mind readily

Of  
Invention.

readily acquiesces in them, or at least yields them that degree of credit which is necessary to render them pleasing. Hence the fairies, ghosts, and witches of Shakspeare, are admitted as probable beings; and angels obtain a place in religious pictures, though we know that they do not now appear in the scenery of real life. Even when a popular opinion has long been exploded, and has become repugnant to universal belief, the fictions built upon it are still admitted as natural, because they were accounted such by the people to whom they were first addressed; whose sentiments and views of things we are willing to adopt, when, by the power of pleasing description, we are introduced into their scenes, and made acquainted with their manners. Hence we admit the theology of the ancient poets, their Elysium and Tartarus, Scylla and Charybdis, Cyclops and Circe, and the rest of those "beautiful wonders" (as Horace calls them) which were believed in the heroic ages; as well as the demons and enchantments of Tasso, which may be supposed to have obtained no small degree of credit among the Italians of the 16th century, and are suitable enough to the notions that prevailed universally in Europe not long before (A). In fact, when poetry is in other respects true; when it gives an accurate display of those parts of nature about which we know that men in all ages must have entertained the same opinion, namely, those appearances in the visible creation, and those feelings and workings of the human mind, which are obvious to all mankind;—when poetry is thus far according to nature, we are very willing to be indulgent to what is fictitious in it, and to grant a temporary allowance to any system of fable which the author pleases to adopt; provided that he lay the scene in a distant country, or fix the date to a remote period. This is no unreasonable piece of complaisance: we owe it both to the poet and to ourselves; for without it we should neither form a right estimate of his genius, nor receive from his works that pleasure which they were intended to impart. Let him, however, take care, that his system of fable be such as his countrymen and cotemporaries (to whom his work is immediately addressed) might be supposed capable of yielding their assent to; for otherwise we should not believe him to be in earnest: and let him connect it as much as he can with probable circumstances, and make it appear in a series of events consistent with itself.

For (thirdly) if this be the case, we shall admit his story as probable, or at least as natural, and consequently be interested in it, even though it be not warranted by general experience, and derive but slender authority from popular opinion. Caliban, in the Tempest, would have shocked the mind as an improbability, if we had not been made acquainted with his origin, and seen his character displayed in a series of consistent behaviour. But when we are told that he sprang from a witch and a demon, a connection not contrary to the laws of nature, as they were under-

flood in Shakspeare's time, and find his manners conformable to his descent, we are easily reconciled to the fiction. In the same sense, the Lilliputians of Swift may pass for probable beings; not so much because we know that a belief in pygmies was once current in the world, (for the true ancient pygmy was at least thrice as tall as those whom Gulliver visited), but because we find that every circumstance relating to them accords with itself, and with their supposed character. It is not the size of the people only that is diminutive; their country, seas, ships, and towns, are all in exact proportion; their theological and political principles, their passions, manners, customs, and all the parts of their conduct, betray a levity and littleness perfectly suitable; and so simple is the whole narration, and apparently so artless and sincere, that we should not much wonder if it had imposed (as we have been told it has) upon some persons of no contemptible understanding. The same degree of credit may perhaps, for the same reasons, be due to his giants. But when he grounds his narrative upon a contradiction to nature; when he presents us with rational brutes, and irrational men; when he tells us of horses building houses for habitation, milking cows for food, riding in carriages, and holding conversations on the laws and politics of Europe; not all his genius (and he there exerts it to the utmost) is able to reconcile us to so monstrous a fiction: we may smile at some of his absurd exaggerations; we may be pleased with the energy of style, and accuracy of description, in particular places; and a malevolent heart may triumph in the satire; but we can never relish it as a fable, because it is at once unnatural and self-contradictory. Swift's judgment seems to have forsaken him on this occasion: he wallows in naïvetés and brutality; and the general run of his satire is downright defamation. Lucian's *True History* is a heap of extravagancies put together without order or unity, or any other apparent design than to ridicule the language and manner of grave authors. His ravings, which have no better right to the name of *Fable*, than a hill of rubbish has to that of palace, are destitute of every colour of plausibility. Animal trees, ships sailing in the sky, armies of monstrous things travelling between the sun and moon upon a pavement of cobwebs, rival nations of men inhabiting woods and mountains in a whale's belly,—are liker the dreams of a bedlamite than the inventions of a rational being.

If we were to prosecute this subject any further, it would be proper to remark, that in some kinds of poetical invention a stricter probability is required than in others:—that, for instance, Comedy, whether dramatic or narrative (B), must seldom deviate from the ordinary course of human affairs, because it exhibits the manners of real, and even of familiar life:—that the tragic poet, because he imitates characters more exalted, and generally refers to events little known, or long since past, may be allowed a wider range; but must never attempt the marvellous fictions of the epic muse.

Beattie's  
Essays,  
ut supra.

(A) In the 14th century, the common people of Italy believed, that the poet Dante went down to hell; that the *Inferno* was a true account of what he saw there; and that his fallow complexion, and stunted beard, (which seemed by its growth and colour to have been too near the fire), where the consequence of his passing so much of his time in that hot and smoky region. See *Viende della letteratura del Sig. C. Denina, cap. 4.*

(B) Fielding's *Tom Jones*, *Amelia*, and *Joseph Andrews*, are examples of what may be called the *Epic* or *Narrative Comedy*, or more properly, perhaps, the *Comic Epopee*.

muse, because he addresses his work, not only to the passions and imagination of mankind, but also to their eyes and ears, which are not easily imposed on, and refuse to be gratified with any representation that does not come very near the truth:—that the epic poem may claim still ampler privileges, because its fictions are not subject to the scrutiny of any outward sense, and because it conveys information in regard both to the highest human characters, and the most important and wonderful events, and also to the affairs of unseen worlds and superior beings. Nor would it be improper to observe, that the several species of comic, of tragic, of epic composition, are not confined to the same degree of probability: for that farce may be allowed to be less probable than the regular comedy; the masque than the regular tragedy; and the mixed epic, such as the *Fairy Queen*, and *Orlando Furioso*, than the pure epopee of *Homer*, *Virgil*, and *Milton*. But this part of the subject seems not to require further illustration. Enough has been said to show, that nothing unnatural can please; and that therefore poetry, whose end is to please, must be according to nature.

And if so, it must be, either according to real nature, or according to nature somewhat different from the reality.

### SECT. III. *Of the System of Nature exhibited by Poetry.*

1. To exhibit real nature is the business of the historian; who, if he were strictly to confine himself to his own sphere, would never record even the minutest circumstance of any speech, event, or description, which was not warranted by sufficient authority. It has been the language of critics in every age, that the historian ought to relate nothing as true which is false or dubious, and to conceal nothing material which he knows to be true. But it is to be doubted whether any writer of profane history has ever been so scrupulous. *Thucydides* himself, who began his history when that war began which he records, and who set down every event soon after it happened, according to the most authentic information, seems, however, to have indulged his fancy not a little in his harangues and descriptions, particularly that of the plague of Athens: and the same thing has been practised, with greater latitude, by *Livy* and *Tacitus*, and more or less by all the best historians both ancient and modern. Nor are they to be blamed for it. By these improved or invented speeches, and by the heightenings thus given to their descriptions, their work becomes more interesting, and more useful; nobody is deceived, and historical truth is not materially affected. A medium is, however, to be observed in this, as in other things. When the historian lengthens a description into a detail of fictitious events, as *Voltaire* has done in his account of the battle of *Fontenoy*, he loses his credit with us, by raising a suspicion that he is more intent upon a pretty story, than upon the truth. And we are disgusted with his insincerity, when, in defiance even of verisimilitude, he puts long elaborate orations in the mouth of those, of whom we know, either from the circumstances that they could not, or from more authentic records that they did not, make any such orations; as *Dionysius of Halicarnassus* has done in

the case of *Volumnia* haranguing her son *Coriolanus*, and *Flavius Josephus* in that of *Judah* addressing his brother as viceroy of Egypt. From what these historians relate, one would conjecture, that the Roman matron had studied at Athens under some long-winded rhetorician, and that the Jewish patriarch must have been one of the most flowery orators of antiquity. But the fictitious part of history, or of story-telling, ought never to take up much room; and must be highly blameable when it leads into any mistake either of facts or of characters.

Now, why do historians take the liberty to embellish their works in this manner? One reason, no doubt, is, that they may display their talents in oratory and narration: but the chief reason, as hinted already, is, to render their composition more agreeable. It would seem, then, that something more pleasing than real nature, or something which shall add to the pleasing qualities of real nature, may be devised by human fancy. And this may certainly be done. And this is the poet's business to do. And when this is in any degree done by the historian, his narrative becomes in that degree poetical.

The possibility of thus improving upon nature must be obvious to every one. When we look at a landscape, we can fancy a thousand additional embellishments. Mountains loftier and more picturesque; rivers more copious, more limpid, and more beautifully winding; smoother and wider lawns; valleys more richly diversified; caverns and rocks more gloomy and more stupendous; ruins more majestic; buildings more magnificent; oceans more varied with islands, more splendid with shipping, or more agitated by storm, than any we have ever seen, it is easy for human imagination to conceive. Many things in art and nature exceed expectation; but nothing sensible transcends, or equals, the capacity of thought!—A striking evidence of the dignity of the human soul! The finest woman in the world appears to every eye susceptible of improvement, except perhaps to that of her lover. No wonder, then, if in poetry events can be exhibited more compact, and of more pleasing variety, than those delineated by the historian, and scenes of inanimate nature more dreadful or more lovely, and human characters more sublime and more exquisite, both in good and evil. Yet still let nature supply the ground-work and materials, as well as the standard, of poetical fiction. The most expert painters use a layman, or other visible figure, to direct their hand and regulate their fancy. *Homer* himself founds his two poems on authentic tradition; and tragic as well as epic poets have followed the example. The writers of romance, too, are ambitious to interweave true adventures with their fables; and when it can be conveniently done, to take the outlines of their plan from real life. Thus the tale of *Robinson Crusoe* is founded on an incident that actually befel one *Alexander Selkirk*, a sea-faring man, who lived several years alone in the island of *Juan Fernandez*: *Smollet* is thought to have given us several of his own adventures in the history of *Roderic Random*; and the chief characters in *Tom Jones*, *Joseph Andrews*, and *Pamela*, are said to have been copied from real originals.—Dramatic comedy, indeed, is for the most part purely fictitious: for if it were to exhibit real events

Of  
Nature in  
Poetry.

Of  
Nature in  
Poetry.

as well as present manners, it would become too personal to be endured by a well-bred audience, and degenerate into downright abuse; which appears to have been the case with the old comedy of the Greeks \*. But in general, hints taken from real existence will be found to give no little grace and stability to fiction, even in the most fanciful poems. Those hints, however, may be improved by the poet's imagination, and set off with every probable ornament that can be devised, consistently with the design and genius of the work;—or, in other words, with the sympathies that the poet means to awaken in the mind of his reader. For mere poetical ornament, when it fails to interest the affections, is not only useless but improper; all true poetry being addressed to the heart, and intended to give pleasure by raising or soothing the passions;—the only effectual way of pleasing a rational and moral creature. And therefore we would take Horace's maxim to be universal in poetry: "*Non satis est, pulchra esse poemata; dulcia suntu*:" "It is not enough that poems be beautiful; let them also be affecting." For that this is the meaning of the word *dulcia* in this place, is admitted by the best interpreters, and is indeed evident from the context †.

† Hor. *Ar. Poet.* vers. 95.—100.

That the sentiments and feelings of percipient beings, when expressed in poetry, should call forth our affections, is natural enough; but can descriptions of inanimate things also be made affecting? Certainly they can: and the more they affect, the more they please us, and the more poetical we allow them to be. Virgil's *Georgic* is a noble specimen (and indeed the noblest in the world) of this sort of poetry. His admiration of external nature gains upon a reader of taste, till it rises to perfect enthusiasm. The following observations will perhaps explain this matter.

Every thing in nature is complex in itself, and bears innumerable relations to other things; and may therefore be viewed in an endless variety of lights, and consequently described in an endless variety of ways. Some descriptions are good, and others bad. An historical description, that enumerates all the qualities of any object, is certainly good, because it is true; but may be as uninteresting as a logical definition. In poetry, no uninteresting description is good, however conformable to truth; for here we expect not a complete enumeration of qualities, (the chief end of the art being to please), but only such an enumeration as may give a lively and interesting idea. It is not memory, or the knowledge of rules, that can qualify a poet for this sort of description; but a peculiar liveliness of fancy and sensibility of heart, the nature whereof we may explain by its effects, but we cannot lay down rules for the attainment of it.

When our mind is occupied by any emotion, we naturally use words and meditate on things that are suitable to it and tend to encourage it. If a man were to write a letter when he is very angry, there would probably be something of vehemence or bitterness in the style, even though the person to whom he wrote were not the object of his anger. The same thing holds true of every other strong passion or emotion:—while it predominates in the mind, it gives a

peculiarity to our thoughts, as well as to our voice, gesture, and countenance: And hence we expect, that every personage introduced in poetry should see things through the medium of his ruling passion, and that his thoughts and language should be tinged accordingly. A melancholy man walking in a grove, attends to those things that suit and encourage his melancholy; the sighing of the wind in the trees, the murmuring of waters, the darkness and solitude of the shades: A cheerful man in the same place, finds many subjects of cheerful meditation, in the singing of birds, the brisk motions of the babbling stream, and the liveliness and variety of the verdure. Persons of different characters, contemplating the same thing, a Roman triumph, for instance, feel different emotions, and turn their view to different objects. One is filled with wonder at such a display of wealth and power; another exults in the idea of conquest, and pants for military renown; a third, stunned with clamour, and harassed with confusion, wishes for silence, security, and solitude; one melts with pity to the vanquished, and makes many a sad reflection upon the insignificance of worldly grandeur, and the uncertainty of human things; while the buffoon, and perhaps the philosopher, considers the whole as a vain piece of pageantry, which, by its solemn procedure, and by the admiration of so many people, is only rendered the more ridiculous:—and each of these persons would describe it in a way suitable to his own feelings, and tending to raise the same in others. We see in Milton's *Allegro* and *Penoso*, how a different cast of mind produces a variety in the manner of conceiving and contemplating the same rural scenery. In the former of these excellent poems, the author personates a cheerful man, and takes notice of those things in external nature that are suitable to cheerful thoughts, and tend to encourage them: in the latter, every object described is serious and solemn, and productive of calm reflection and tender melancholy: and we should not be easily persuaded, that Milton wrote the first under the influence of sorrow, or the second under that of gladness. We often see an author's character in his works; and if every author were in earnest when he writes, we should often see it. Thomson was a man of piety and benevolence, and a warm admirer of the beauties of nature; and every description in his delightful poem on the Seasons tends to raise the same laudable affections in his reader. The parts of nature that attract his notice are those which an impious or hard-hearted man would neither attend to, nor be affected with, at least in the same manner. In Swift we see a turn of mind very different from that of the amiable Thomson; little relish for the sublime or beautiful, and a perpetual succession of violent emotions. All his pictures of human life seem to show, that deformity and meanness were the favourite objects of his attention, and that his soul was a constant prey to indignation (c), disgust, and other gloomy passions, arising from such a view of things. And it is the tendency of almost all his writings, (though it was not always the author's design), to communicate the same passions to his reader: inasmuch, that notwithstanding his erudition and know-

Beattie's  
Essays,  
ut supra.

(c) For part of this remark we have his own authority, often in his letters, and very explicitly in the Latin epigraph which he composed for himself:—"ubi sæva indignatio ulterius cor lacerare nequit." See his *last will and testament*.

knowledge of the world, his abilities as a popular orator and man of business, the energy of his style, the elegance of some of his verses, and his extraordinary talents in wit and humour, there is reason to doubt, whether by studying his works any person was ever much improved in piety or benevolence.

And thus we see, how the compositions of an ingenious author may operate upon the heart, whatever be the subject. The affections that prevail in the author himself direct his attention to objects congenial, and give a peculiar bias to his inventive powers, and a peculiar colour to his language. Hence his work, as well as face, if nature is permitted to exert herself freely in it, will exhibit a picture of his mind, and awaken correspondent sympathies in the reader. When these are favourable to virtue, which they always ought to be, the work will have that sweet pathos which Horace alludes in the passage above mentioned; and which we so highly admire, and so warmly approve, even in those parts of the *Georgic* that describe inanimate nature.

Horace's account of the matter in question differs not from what is here given. "It is not enough (says he) that poems be beautiful; let them be affecting, and agitate the mind with whatever passions the poet wishes to impart. The human countenance, as it smiles on those who smile, accompanies also with sympathetic tears those who mourn. If you would have me weep, you must first weep yourself; then, and not before, shall I be touched with your misfortunes.—For nature first makes the emotions of our mind correspond with our circumstances, insuring real joy, sorrow, or resentment, according to the occasion; and afterwards gives the true pathetic utterance to the voice and language." This doctrine, which concerns the orator and the player no less than the poet, is strictly philosophical, and equally applicable to dramatic, to descriptive, and indeed to every species of interesting poetry. The poet's sensibility must first of all engage him warmly in his subject, and in every part of it; otherwise he will labour in vain to interest the reader. If he would paint external nature, as Virgil and Thomson have done, so as to make her amiable to others, he must first be enamoured of her himself; if he would have his heroes and heroines speak the language of love or sorrow, devotion or courage, ambition or anger, benevolence or pity, his heart must be susceptible of those emotions, and in some degree feel them, as long at least as he employs himself in framing words for them; being assured, that

He best shall paint them who can feel them most.

Pope's *Elois*, v. 366.

The true poet, therefore, must not only study nature, and know the reality of things; but must also possess fancy, to invent additional decorations; judgment, to direct him in the choice of such as accord with verisimilitude; and sensibility, to enter with ardent emotions into every part of his subject, so as to transmute into every part of his work a pathos and energy sufficient to raise corresponding emotions in the reader.

"The historian and the poet (says Aristotle) differ in this, that the former exhibits things as they are, the latter as they might be;"—i. e. in that state of perfection which is consistent with probability, and in which, for the sake of our own gratification, we wish to find them. If the poet, after all the liberties he is

allowed to take with the truth, can produce nothing more exquisite than is commonly to be met with in history, his reader will be disappointed and dissatisfied. Poetical representations must therefore be framed after a pattern of the highest probable perfection that the genius of the work will admit:—external nature must in them be more picturesque than in reality; action more animated; sentiments more expressive of the feelings and character, and more suitable to the circumstances of the speaker; personages better accomplished in those qualities that raise admiration, pity, terror, and other ardent emotions; and events, more compact, more clearly connected with causes and consequences, and unfolded in an order more flattering to the fancy, and more interesting to the passions. But where, it may be said, is this pattern of perfection to be found? Not in real nature; otherwise history, which delineates real nature, would also delineate this pattern of perfection. It is to be found only in the mind of the poet; and it is imagination, regulated by knowledge, that enables him to form it.

In the beginning of life, and while experience is confined to a small circle, we admire every thing, and are pleased with very moderate excellence. A peasant thinks the hall of his landlord the finest apartment in the universe, listens with rapture to the strolling ballad-singer, and wonders at the rude wooden cuts that adorn his ruder compositions. A child looks upon his native village as a town; upon the brook that runs by, as a river; and upon the meadows and hills in the neighbourhood, as the most spacious and beautiful that can be. But when, after long absence, he returns in his declining years, to visit, once before he die, the dear spot that gave him birth, and those scenes whereof he remembers rather the original charms than the exact proportions; how is he disappointed to find every thing so debased, and so diminished! The hills seem to have sunk into the ground, the brook to be dried up, and the village to be forsaken of its people; the parish-church, stripped of all its fancied magnificence, is become low, gloomy, and narrow; and the fields are now only the miniature of what they were. Had he never left this spot, his notions might have remained the same as at first; and had he travelled but a little way from it, they would not perhaps have received any material enlargement. It seems then to be from observation of many things of the same or similar kinds, that we acquire the talent of forming ideas more perfect than the real objects that lie immediately around us: and these ideas we may improve gradually more and more, according to the vivacity of our mind, and extent of our experience, till at last we come to raise them to a degree of perfection superior to any thing to be found in real life. There cannot, sure, be any mystery in this doctrine; for we think and speak to the same purpose every day. Thus nothing is more common than to say, that such an artist excels all we have ever known in his profession, and yet that we can still conceive a superior performance. A moralist, by bringing together into one view the separate virtues of many persons, is enabled to lay down a system of duty more perfect than any he has ever seen exemplified in human conduct. Whatever be the emotion the poet intends to raise in his reader, whether admiration or terror, joy or sorrow; and whatever be the object he would exhibit,

Of Nature  
in Poetry.

exhibit, whether Venus or Tisiphone, Achilles or Theseus, a palace or a pile of ruins, a dance or a battle; he generally copies an idea of his own imagination; considering each quality as it is found to exist in several individuals of a species, and thence forming an assemblage more or less perfect in its kind, according to the purpose to which he means to apply it.

Hence it would appear, that the ideas of poetry are rather general than singular; rather collected from the examination of a species or class of things, than copied from an individual. And this, according to Aristotle, is in fact the case, at least for the most part; whence that critic determines, that poetry is something more exquisite and more philosophical than history\*. The historian may describe Bucephalus, but the poet delineates a war-horse; the former must have seen the animal he speaks of, or received authentic information concerning it, if he mean to describe it historically; for the latter, it is enough that he has seen several animals of that sort. The former tells us, what Achilles actually did and said; the latter, what such a species of human character as that which bears the name of Achilles would probably do or say in certain given circumstances.

It is indeed true, that the poet may, and often does, copy after individual objects. Homer, no doubt, took his characters from the life; or at least, in forming them, was careful to follow tradition as far as the nature of his plan would allow. But he probably took the freedom to add or heighten some qualities, and take away others; to make Achilles, for example, stronger, perhaps, and more impetuous, and more eminent for filial affection, and Hector more patriotic and more amiable, than he really was. If he had not done this, or something like it, his work would have been rather a history than a poem; would have exhibited men and things as they were, and not as they might have been; and *Achilles* and *Hector* would have been the names of individual and real heroes; whereas, according to Aristotle, they are rather to be considered as two distinct modifications or species of the heroic character. Shakspeare's account of the cliffs of Dover comes so near the truth, that we cannot doubt of its having been written by one who had seen them: but he who takes it for an exact historical description, will be surpris'd when he comes to the place, and finds those cliffs not half so lofty as the poet had made him believe. An historian would be to blame for such amplification; because, being to describe an individual precipice, he ought to tell us just what it is; which if he did, the description would suit that place, and perhaps no other in the whole world. But the poet means only to give an idea of what such a precipice may be; and therefore his description may perhaps be equally applicable to many such chalky precipices on the seashore.

This method of copying after general ideas formed by the artist from observation of many individuals, distinguishes the Italian and all the sublime painters, from the Dutch and their imitators. These give us bare nature, with the imperfections and peculiarities of individual things or persons; but those give nature improved as far as probability and the design of the piece will admit. Teniers and Hogarth draw faces, and figures, and dresses, from real life, and present man-

ners; and therefore their pieces must in some degree lose the effect, and become awkward, when the present fashions become obsolete.—Raphael and Reynolds take their models from general nature; avoiding, as far as possible, (at least in all their great performances), those peculiarities that derive their beauty from mere fashion; and therefore their works must give pleasure, and appear elegant, as long as men are capable of forming general ideas, and of judging from them. The last-mentioned incomparable artist is particularly observant of children, whose looks and attitudes, being less under the control of art and local manners, are more characteristic of the species than those of men and women. This field of observation has supplied him with many fine figures, particularly that most exquisite one of Comedy, struggling for and winning (for who could resist her!) the affections of Garrick:—a figure which could never have occurred to the imagination of a painter who had confined his views to grown persons looking and moving in all the formality of polite life;—a figure which in all ages and countries would be pronounced natural and engaging;—whereas those human forms that we see every day bowing, and courtesying, and flustering, and turning out their toes *secundum artem*, and dressed in ruffles, and wigs, and flounces, and hoop-petticoats, and full-trimmed suits, would appear elegant no further than the present fashions are propagated, and no longer than they remain unaltered.

There is, in the progress of human society, as well as of human life, a period to which it is of great importance for the higher order of poets to attend, and from which they will do well to take their characters, and manners, and the æra of their events; namely, that wherein men are raised above savage life, and considerably improved by arts, government, and conversation; but not advanced so high in the ascent towards politeness, as to have acquired a habit of disguising their thoughts and passions, and of reducing their behaviour to the uniformity of the mode. Such was the period which Homer had the good fortune (as a poet) to live in, and to celebrate. This is the period at which the manners of men are most picturesque, and their adventures most romantic. This is the period when the appetites unperturbed by luxury, the powers unenervated by effeminacy, and the thoughts disengaged from artificial restraint, will, in persons of similar dispositions and circumstances, operate in nearly the same way; and when, consequently, the characters of particular men will approach to the nature of poetical or general ideas, and, if well imitated, give pleasure to the whole, or at least to a great majority of mankind. But a character tinged with the fashions of polite life would not be so generally interesting. Like a human figure adjusted by a modern dancing-master, and dressed by a modern tailor, it may have a good effect in satire, comedy, or farce: but if introduced into the higher poetry, it would be admired by those only who had learned to admire nothing but present fashions, and by them no longer than the present fashions lasted; and to all the rest of the world would appear awkward, unaffectioning, and perhaps ridiculous. But Achilles and Sarpedon, Diomedes and Hector, Nestor and Ulysses, as drawn by Homer, must in all ages, independently on fashion, command the attention and ad-

Characters.Of Poetical  
Characters.

miration of mankind. These have the qualities that are universally known to belong to human nature; whereas the modern fine gentleman is distinguished by qualities that belong only to a particular age, society, and corner of the world. We speak not of moral or intellectual virtues, which are objects of admiration to every age; but of those outward accomplishments, and that particular temperature of the passions, which form the most perceptible part of a human character.——As, therefore, the politician, in discussing the rights of mankind, must often allude to an imaginary state of nature; so the poet who intends to raise admiration, pity, terror, and other important emotions, in the generality of mankind, especially in those readers whose minds are most improved, must take his pictures of life and manners, rather from the heroic period we now speak of, than from the ages of refinement; and must therefore (to repeat the maxim of Aristotle) “exhibit things, not as they are, but as they might be.”

#### SECT. IV Of Poetical Characters.

12. HORACE seems to think, that a competent knowledge of moral philosophy will fit an author for assigning the suitable qualities and duties to each poetical personage: (*Ar. Poet. v. 309.—316.*) The maxim may be true, as far as mere morality is the aim of the poet; but cannot be understood to refer to the delineation of poetical characters in general: for a thorough acquaintance with all the moral philosophy in the world would not have enabled Blackmore to paint such a personage as Homer's Achilles, Shakespeare's Othello, or the Satan of Paradise Lost. To a competency of moral science, there must be added an extensive knowledge of mankind, a warm and elevated imagination, and the greatest sensibility of heart, before a genius can be formed equal to so difficult a task. Horace is indeed so sensible of the danger of introducing a new character in poetry, that he even discourages the attempt, and advises the poet rather to take his persons from the ancient authors, or from tradition: (*Ibid. v. 119.—130.*)

To conceive the idea of a good man, and to invent and support a great poetical character, are two very different things, however they may seem to have been confounded by some late critics. The first is easy to any person sufficiently instructed in the duties of life: the last is perhaps of all the efforts of human genius the most difficult; so very difficult, that, though attempted by many, Homer, Shakespeare, and Milton, are almost the only authors who have succeeded in it. But characters of perfect virtue are not the most proper for poetry. It seems to be agreed, that the Deity should not be introduced in the machinery of a poetical fable. To ascribe to him words and actions of our own invention, seems very unbecoming; nor can a poetical description, that is known to be, and must of necessity be, infinitely inadequate, ever satisfy the human mind. Poetry, according to the best critics, is an imitation of human action; and therefore poetical characters, though elevated, should still partake of the passions and frailties of humanity. If it were not for the vices of some principal personages, the *Iliad* would not be either so interesting or so moral:—the most moving and most eventful parts of the *Æneid* are those that describe the effects of unlawful passion:—

the most instructive tragedy in the world, we mean *Macbeth*, is founded in crimes of dreadful enormity:—and if Milton had not taken into his plan the fall of our first parents, as well as their state of innocence, his divine poem must have wanted much of its pathos, and could not have been (what it now is) such a treasure of important knowledge, as no other uninspired writer ever comprehended in so small a compass.——Virtue, like truth, is uniform and unchangeable. We may anticipate the part a good man will act in any given circumstances: and therefore the events that depend on such a man must be less surprising than those which proceed from passion; the vicissitudes whereof it is frequently impossible to foresee. From the violent temper of Achilles in the *Iliad*, spring many great incidents; which could not have taken place, if he had been calm and prudent like Ulysses, or pious and patriotic like Æneas:—his rejection of Agamemnon's offers, in the ninth book, arises from the violence of his resentment;—his yielding to the request of Patroclus, in the 16th, from the violence of his friendship (if we may so speak) counteracting his resentment; and his restoring to Priam the dead body of Hector, in the 24th, from the violence of his affection to his own aged father, and his regard to the command of Jupiter, counteracting, in some measure, both his sorrow for his friend, and his thirst for vengeance.——Besides, except where there is some degree of vice, it pains us too exquisitely to see misfortune; and therefore poetry would cease to have a pleasurable influence over our tender passions, if it were to exhibit virtuous characters only. And as in life, evil is necessary to our moral probation, and the possibility of error to our intellectual improvement; so bad or mixed characters are useful in poetry, to give to the good such opposition, as puts them upon displaying and exercising their virtue.

All those personages, however, in whose fortune the poet means that we should be interested, must have agreeable and admirable qualities to recommend them to our regard. And perhaps the greatest difficulty in the art lies in suitably blending those faults, which the poet finds it expedient to give to any particular hero, with such moral, intellectual, or corporeal accomplishments, as may engage our esteem, pity, or admiration, without weakening our hatred of vice, or love of virtue. In most of our novels, and in many of our plays, it happens unluckily, that the hero of the piece is so captivating, as to incline us to be indulgent to every part of his character, the bad as well as the good. But a great master knows how to give the proper direction to human sensibility; and, without any perversion of our faculties, or any confusion of right and wrong, to make the same person the object of very different emotions, of pity and hatred, of admiration and horror. Who does not esteem and admire *Macbeth* for his courage and generosity? who does not pity him when beset with all the terrors of a pregnant imagination, superstitious temper, and awakened conscience? who does not abhor him as a monster of cruelty, treachery, and ingratitude? His good qualities, by drawing us near to him, make us, as it were, eye-witnesses of his crime, and give us a fellow-feeling of his remorse; and therefore, his example cannot fail to have a powerful effect in cherishing our love of virtue,

Of Poetical  
Characters.Of Poetical  
Characters.

virtue, and fortifying our minds against criminal impressions: whereas, had he wanted those good qualities, we should have kept aloof from his concerns, or viewed them with a superficial attention; in which case his example would have had little more weight, than that of the robber, of whom we know nothing, but that he was tried, condemned, and executed.—Satan, in *Paradise Lost*, is a character drawn and supported with the most consummate judgment. The old furies and demons, Hecate, Tisiphone, Alecto, Megara, are objects of unmixed and unmitigated abhorrence; Tityus, Enceladus, and their brethren, are remarkable for nothing but impiety, deformity, and vastness of size; Pluto is, at best, an insipid personage; Mars, a hairbrained ruffian; Tasso's infernal tyrant, an ugly and overgrown monster:—but in the Miltonic Satan, we are forced to admire the majesty of the ruined archangel, at the same time that we detest the unconquerable depravity of the fiend. “But, of all poetical characters, (says the elegant critic from whom we are extracting,) the Achilles of Homer (F) seems to me the most exquisite of the invention, and the most highly finished. The utility of this character in a moral view is obvious; for it may be considered as the source of all the morality of the *Iliad*. Had not the generous and violent temper of Achilles determined him to patronise the augur Calchas in defiance of Agamemnon, and afterwards, on being affronted by that vindictive commander, to abandon for a time the common cause of Greece;—the fatal effects of dissension among confederates, and of capricious and tyrannical behaviour in a sovereign, would not have been the leading moral of Homer's poetry; nor could Hector, Sarpedon, Eneas, Ulysses, and the other amiable heroes, have been brought forward to signalize their virtues, and recommend themselves to the esteem and imitation of mankind.

“They who form their judgment of Achilles from the imperfect sketch given of him by Horace in the *Art of Poetry*, (v. 121, 122.) and consider him only as a hateful composition of anger, revenge, fierceness, obstinacy, and pride, can never enter into the views of Homer, nor be suitably affected with his narration. All these vices are no doubt, in some degree, combined in Achilles; but they are tempered with qualities of a different sort, which render him a most interesting character, and of course make the *Iliad* a most interesting poem. Every reader abhors the faults of this hero: and yet, to an attentive reader of Homer, this hero must be the object of esteem, admiration, and pity; for he has many good as well as bad affections, and is equally violent in all:—Nor is he possessed of a single vice or virtue, which the wonderful art of the poet has not made subservient to the design of the poem, and to the progress and catastrophe of the action; so that the hero of the *Iliad*, considered as a poetical personage, is just what he should be, neither

greater nor less, neither worse nor better.—He is every where distinguished by an abhorrence of oppression, by a liberal and elevated mind, by a passion for glory, and by a love of truth, freedom, and sincerity. He is for the most part attentive to the duties of religion; and, except to those who have injured him, courteous and kind: he is affectionate to his tutor Phoenix; and not only pities the misfortunes of his enemy Priam, but in the most soothing manner administers to him the best consolation that poor Homer's theology could furnish. Though no admirer of the cause in which his evil destiny compels him to engage, he is warmly attached to his native land; and, ardent as he is in vengeance, he is equally so in love to his aged father Peleus, and to his friend Patroclus. He is not luxurious like Paris, nor clownish like Ajax; his accomplishments are princely, and his amulements worthy of a hero. Add to this, as an apology for the vehemence of his anger, that the affront he had received was (according to the manners of that age) of the most atrocious nature; and not only unprovoked, but such as, on the part of Agamemnon, betrayed a brutal insensibility to merit, as well as a proud, selfish, ungrateful, and tyrannical disposition. And though he is often inexcusably furious; yet it is but justice to remark, that he was not naturally cruel (G); and that his wildest outrages were such as in those rude times might be expected from a violent man of invincible strength and valour, when exasperated by injury, and frantic with sorrow.—Our hero's claim to the admiration of mankind is indisputable. Every part of his character is sublime and astonishing. In his person, he is the strongest, the swiftest, and most beautiful of men:—this last circumstance, however, occurs not to his own observation, being too trivial to attract the notice of so great a mind. The Fates had put it in his power, either to return home before the end of the war, or to remain at Troy:—if he chose the former, he would enjoy tranquillity and happiness in his own country to a good old age; if the latter, he must perish in the bloom of his youth:—his affection to his father and native country, and his hatred to Agamemnon, strongly urged him to the first; but a desire to avenge the death of his friend determines him to accept the last, with all its consequences. This at once displays the greatness of his fortitude, the warmth of his friendship, and the violence of his sanguinary passions: and it is this that so often and so powerfully recommends him to the pity, as well as admiration, of the attentive reader.”

It is equally a proof of rich invention and exact judgment in Homer, that he mixes some good qualities in all his bad characters, and some degree of imperfection in almost all his good ones.—Agamemnon, notwithstanding his pride, is an able general, and a valiant man, and highly esteemed as such by the greater part of the army.—Paris, though effeminate,

35 G 2

(F) “I say the *Achilles* of HOMER. Latter authors have degraded the character of this hero, by supposing every part of his body invulnerable except the heel. I know not how often I have heard this urged as one of Homer's absurdities; and indeed the whole *Iliad* is one continued absurdity, on this supposition. But Homer all along makes his hero equally liable to wounds and death with other men. Nay, to prevent all mistakes in regard to this matter, (if those who cavil at the poet would but read his work,) he actually wounds him in the right arm by the lance of Afterpous, in the battle near the river Scamander. See *Iliad*, xxi. ver. 161.—168.

(G) See *Iliad* xxi. 100. and xxiv. 485.—673.—In the first of these passages, Achilles himself declares, that before Patroclus was slain, he often spared the lives of his enemies, and took pleasure in doing it. It is strange, as Dr Beattie observes, that this should be left out in Pope's Translation.

Beattie's  
Essays.

nate, and vain of his dress and person, is, however, good-natured, patient of reproof, not destitute of courage, and eminently skilled in music and other fine arts.—Ajax is a huge giant; fearless rather from insensibility to danger, and confidence in his mazy arms, than from any nobler principle; boastful and rough; regardless of the gods, though not downright impious: yet there is in his manner something of frankness and blunt sincerity, which entitle him to a share in our esteem; and he is ever ready to assist his countrymen, to whom he renders good service on many a perilous emergency.—The character of Helen, in spite of her faults, and of the many calamities whereof she is the guilty cause, Homer has found means to recommend to our pity, and almost to our love; and this he does, without seeking to extenuate the crime of Paris, of which the most respectable personages in the poem are made to speak with becoming abhorrence. She is so full of remorse, so ready on every occasion to condemn her past conduct, so affectionate to her friends, so willing to do justice to every body's merit, and withal so finely accomplished, that she extorts our admiration, as well as that of the Trojan senators.—Menelaus, though sufficiently sensible of the injury he had received, is yet a man of moderation, clemency, and good-nature, a valiant soldier, and a most affectionate brother: but there is a dash of vanity in his composition, and he entertains rather too high an opinion of his own abilities, yet never overlooks nor undervalues the merit of others.—Priam would claim unreserved esteem, as well as pity, if it were not for his inexcusable weakness, in gratifying the humour, and by indulgence abetting the crimes, of the most worthless of all his children, to the utter ruin of his people, family, and kingdom. Madame Dacier supposes, that he had lost his authority, and was obliged to fall in with the politics of the times: but of this there appears no evidence; on the contrary, he and his unworthy favourite Paris, seem to have been the only persons of distinction in Troy who were averse to the restoring of Helen. Priam's foible (if it can be called by so soft a name), however faulty, is not uncommon, and has often produced calamity both in private and public life. The scripture gives a memorable instance, in the history of the good old Eli.—Sarpedon comes nearer a perfect character, than any other of Homer's heroes; but the part he has to act is short. It is a character, which one could hardly have expected in those rude times: a sovereign prince, who considers himself as a magistrate set up by the people for the public good, and therefore bound in honour and gratitude to be himself their example, and study to excel as much in virtue as in rank and authority.—Hector is the favourite of every reader, and with good reason. To the truest valour he joins the most generous patriotism. He abominates the crime of Paris: but, not being able to prevent the war, he thinks it his duty to defend his country, and his father and sovereign, to the last. He too, as well as Achilles, foresees his own death; which heightens our compassion, and raises our idea of his magnanimity. In all the relations of private life, as a son, a father, a husband, a brother, he is amiable in the highest degree; and he is distinguished among all the heroes for tenderness of affection, gentleness of manners, and a pious regard

to the duties of religion. One circumstance of his character, strongly expressive of a great and delicate mind, we learn from Helen's lamentation over his dead body, that he was almost the only person in Troy, who had always treated her with kindness, and never uttered one reproachful word to give her pain, nor heard others reproach her without blaming them for it. Some tendency to ostentation (which, however, may be pardonable in a commander in chief), and temporary fits of timidity, are the only blemishes discoverable in this hero; whose portrait Homer appears to have drawn with an affectionate and peculiar attention.

By ascribing so many amiable qualities to Hector and some others of the Trojans, the poet interests us in the fate of that people, notwithstanding our being continually kept in mind that they are the injurious party. And by thus blending good and evil, virtue and frailty, in the composition of his characters, he makes them the more conformable to the real appearances of human nature, and more useful as examples for our improvement; and at the same time, without hurting verisimilitude, gives every necessary embellishment to particular parts of his poem, and variety, coherence, and animation, to the whole fable. And it may also be observed, that tho' several of his characters are complex, not one of them is made up of incompatible parts: all are natural and probable, and such as we think we have met with, or might have met with, in our intercourse with mankind.

From the same extensive views of good and evil, in all their forms and combinations, Homer has been enabled to make each of his characters perfectly distinct in itself, and different from all the rest; in so much, that before we come to the end of the Iliad, we are as well acquainted with his heroes, as with the faces and tempers of our most familiar friends. Virgil, by confining himself to a few general ideas of fidelity and fortitude, has made his subordinate heroes a very good sort of people; but they are all the same, and we have no clear knowledge of any one of them. Achilles is faithful, and Gias is brave, and Cloanthus is brave; and this is all we can say of the matter. We see these heroes at a distance, and have some notion of their shape and size; but are not near enough to distinguish their features; and every face seems to exhibit the same faint and ambiguous appearance. But of Homer's heroes we know every particular that can be known. We eat, and drink, and talk, and fight with them: we see them in action, and out of it; in the field, and in their tents and houses:—the very face of the country about Troy, we seem to be as well acquainted with, as if we had been there. Similar characters there are among these heroes, as there are similar faces in every society; but we never mistake one for another. Nestor and Ulysses are both wise, and both eloquent: but the wisdom of the former seems to be the effect of experience; that of the latter, of genius: the eloquence of the one is sweet and copious, but not always to the purpose, and apt to degenerate into story-telling; that of the other is close, emphatical, and persuasive, and accompanied with a peculiar modesty and simplicity of manner. Homer's heroes are all valiant; yet each displays a modification of valour peculiar to himself. One is valiant from principle, another from con-

stitution;

Of Poetical Characters.

pretentious and headstrong, another impetuous, but tractable; one is cruel, another merciful; one is insolent and ostentatious, another gentle and unassuming; one is vain of his person, another of his strength, and a third of his family.—It would be tedious to give a complete enumeration. Almost every species of the heroic character is to be found in Homer.

The *Paradise Lost*, though truly Epic, cannot properly be called an *heroic poem*; for the agents in it are not heroes, but beings of a higher order (1). Of these the poet's plan did not admit the introduction of many; but most of those whom he has introduced, are well characterised. We have already spoken of his Satan, which is the highest imaginable species of the diabolical character. The inferior species are well diversified, and in each variety distinctly marked: one is slothful, another avaricious, a third sophistical, a fourth furious; and though all are impious, some are more outrageously and blasphemously so than others.

—Adam and Eve, in the state of innocence, are characters well imagined, and well supported; and the different sentiments arising from difference of sex, are traced out with inimitable delicacy, and philosophical propriety. After the fall, he makes them retain the same characters, without any other change than what the transition from innocence to guilt may be supposed to produce: Adam has still that pre-eminence in dignity, and Eve in loveliness, which we should naturally look for in the father and mother of mankind.—Of the blessed spirits, Raphael and Michael are well distinguished; the one for affability, and peculiar goodwill to the human race; the other for majesty, but such as commands veneration rather than fear.—We are sorry to add, that Milton's attempt to soar still higher, only shows, that he had already soared as high, as, without being "blasted with excess of light," it is possible for the human imagination to rise.

From what has been said, it seems abundantly evident,—That the end of poetry is to please; and therefore that the most perfect poetry must be the most pleasing;—that what is unnatural cannot give pleasure; and therefore that poetry must be according to nature;—that it must be either according to real nature, or according to nature somewhat different from the reality;—that, if according to real nature, it would give no greater pleasure than history, which is a transcript of real nature;—that greater pleasure is, however, to be expected from it, because we grant it superior indulgence, in regard to fiction, and the choice of words;—and, consequently, that poetry must be, not according to real nature, but according to nature improved to that degree which is consistent with probability and suitable to the poet's purpose.—And hence it is that we call poetry, *An imitation of nature*.—For that which is properly termed *imitation* has always in it something which is not in the original. If the prototype and transcript be exactly alike; if there be nothing in the one which is not in the other; we may call the latter a *representation*, a *copy*, a *draught*,

or a *picture*, of the former; but we never call it an *imitation*.

Of Poetical Arrangement, &amp;c.

#### SECT. V. Of Arrangement, Unity, Digressions. —Further remarks on Nature in Poetry.

13. I. The origin of nations, and the beginnings of great events, are little known, and seldom interesting; whence the first part of every history, compared with the sequel, is somewhat dry and tedious. But a poet must, even in the beginning of his work, interest the readers, and raise high expectation; not by any affected pomp of style, far less by ample promises or bold professions; but by setting immediately before them some incident, striking enough to raise curiosity, in regard both to its causes and to its consequences. He must therefore take up his story, not at the beginning, but in the middle; or rather, to prevent the work from being too long, as near the end as possible; and afterwards take some proper opportunity to inform us of the preceding events, in the way of narrative, or by conversation of the persons introduced, or by short and natural digressions.

The action of both the *Iliad* and *Odyssey* begins about six weeks before its conclusion; although the principal events of the war of Troy are to be found in the former; and the adventures of a ten years voyage, followed by the suppression of a dangerous domestic enemy, in the latter. One of the first things mentioned by Homer in the *Iliad*, is a plague, which Apollo in anger sent into the Grecian army commanded by Agamemnon and now encamped before Troy. Who this Agamemnon was, and who the Grecians were; for what reason they had come hither; how long the siege had lasted; what memorable actions had been already performed, and in what condition both parties now were;—all this, and much more, we soon learn from occasional hints and conversations interspersed through the poem.

In the *Æneid*, which, though it comprehends the transactions of seven years, opens within a few months of the concluding event, we are first presented with a view of the Trojan fleet at sea, and no less a person than Juno intertelling herself to raise a storm for their destruction. This excites a curiosity to know something further: who these Trojans were; whence they had come, and whither they were bound; why they had left their own country, and what had befallen them since they left it. On all these points, the poet, without quitting the track of his narrative, soon gives the fullest information: The storm rises; the Trojans are driven to Africa, and hospitably received by the queen of the country; at whose desire their commander relates his adventures.

The action of *Paradise Lost* commences not many days before Adam and Eve are expelled from the garden of Eden, which is the concluding event. This poem, as its plan is incomparably more sublime and more important than that of either the *Iliad* or *Æneid*, opens with a far more interesting scene: a multitude of angels and archangels shut up in a region of torment and darkness, and rolling on a lake of unquench-

able

(1) Samson, in the *Agonistes*, is a species of the heroic character not to be found in Homer; distinctly marked, and admirably supported. And Delilah, in the same tragedy, is perhaps a more perfect model of an alluring, insinuating, worthless woman, than an other to be met with in ancient or modern poetry.

able fire. Who these angels are, and what brought them into this miserable condition, we naturally wish to know; and the poet in due time informs us; partly from the conversation of the fiends themselves; and more particularly by the mouth of a happy spirit, sent from heaven to caution the father and mother of mankind against temptation, and confirm their good resolutions by unfolding the dreadful effects of impiety and disobedience.

This poetical arrangement of events, so different from the historical, has other advantages besides those arising from brevity, and compactness of detail: it is obviously more affecting to the fancy, and more alarming to the passions; and, being more suitable to the order and the manner in which the actions of other men strikes our senses, is a more exact imitation of human affairs. I hear a sudden noise in the street, and run to see what is the matter. An insurrection has happened, a great multitude is brought together, and something very important is going forward. The scene before me is the first thing that engages my attention; and is in itself so interesting, that for a moment or two I look at it in silence and wonder. By and by, when I get time for reflection, I begin to inquire into the cause of all this tumult, and what it is the people would be at; and one who is better informed than I, explains the affair from the beginning; or perhaps I make this out for myself, from the words and actions of the persons principally concerned.—This is a sort of picture of poetical arrangement, both in epic and dramatic composition; and this plan has been followed in narrative odes and ballads both ancient and modern.—The historian pursues a different method. He begins perhaps with an account of the manners of a certain age, and of the political constitution of a certain country; then introduces a particular person, gives the story of his birth, connections, private character, pursuits, disappointments, and of the events that promoted his views, and brought him acquainted with other turbulent spirits like himself; and so proceeds, unfolding, according to the order of time, the causes, principles, and progress of the conspiracy;—if that be the subject which he undertakes to illustrate. It cannot be denied, that this latter method is more favourable to calm information: but the former, compared with it, will be found to have all the advantages already specified, and to be more effectually productive of that mental pleasure which depends on the passions and imagination.

13. II. If a work have no determinate end, it has no meaning; and if it have many ends, it will distract by its multiplicity. Unity of design, therefore, belongs in some measure to all compositions, whether in verse or prose. But to some it is more essential than to others; and to none so much as to the higher poetry. In certain kinds of history, there is unity sufficient, if all the events recorded be referred to one person; in others, if to one period of time, or to one people, or even to the inhabitants of one and the same planet. But it is not enough, that the subject of a poetical fable be the exploits of one person; for these may be of various and even of opposite sorts and tendencies, and take up longer time than the nature of poetry can admit:—far less can a regular poem comprehend the affairs of one period, or of one people:—it must be li-

mitted to one great action or event, to the illustration of which all the subordinate events must contribute; and these must be so connected with one another, as well as with the poet's general purpose, that one cannot be changed, transposed, or taken away, without affecting the consistency and stability of the whole. In itself an incident may be interesting, a character well drawn, a description beautiful; and yet, if it disfigure the general plan, or if it obstruct or incumber the main action, instead of helping it forward, a correct artist would consider it but as a gaudy superfluity or splendid deformity; like a piece of scarlet cloth sewed upon a garment of a different colour\*. Not that all the parts of the fable either are, or can be, equally essential. Many descriptions and thoughts, of little consequence to the plan, may be admitted for the sake of variety; and the poet may, as well as the historian and philosopher, drop his subject for a time, in order to take up an affecting or instructive digression.

14. III. The doctrine of poetical digressions and episodes has been largely treated by the critics. We shall here only remark, that, in estimating their propriety, three things are to be attended to:—their connection with the fable or subject;—their own peculiar excellence;—and their subserviency to the poet's design.

(1.) Those digressions, that both arise from and terminate in the subject; like the episode of the angel Raphael in *Paradise Lost*, and the transition to the death of Cæsar and the civil wars in the first book of the *Georgic*; are the most artful, and, if suitably executed, claim the highest praise:—those that arise from, but do not terminate in, the subject, are perhaps second in the order of merit; like the story of Dido in the *Æneid*, and the encomium on a country-life in the second book of the *Georgic*:—those come next, that terminate in, but do not rise from, the fable; of which there are several in the third book of the *Æneid*, and in the *Odyssey*:—and those, that neither terminate in the fable, nor rise from it, are the least artful; and if they be long, cannot escape censure, unless their beauty be very great.

But (2.) we are willing to excuse a beautiful episode, at whatever expence to the subject it may be introduced. They who can blame Virgil for obtruding upon them the charming tale of Orpheus and Eurydice in the fourth *Georgic*, or Milton for the apostrophe to light in the beginning of his third book, ought to forfeit all title to the perusal of good poetry; for of such divine strains one would rather be the author, than of all the books of criticism in the world. Yet still it is better, that an episode possess the beauty of connection, together with its own intrinsic elegance, than this without the other.

Moreover, in judging of the propriety of episodes, and other similar contrivances, it may be expedient to attend, (3.) to the design of the poet, as distinguished from the fable or subject of the poem. The great design, for example, of Virgil, was to interest his countrymen in a poem written with a view to reconcile them to the person and government of Augustus. Whatever, therefore, in the poem tends to promote this design, even though it should, in some degree, hurt the contexture of the fable, is really a proof of the poet's judgment; and may be not only allowed, but applauded.—The progress of the action of the *Æneid* may

&c.

† *Artist.*  
*Poet.* § 8.

\* *Hor. Art.*  
*Poet.* v. 15.  
&c.

Of Poetical seem to be too long obstructed in one place, by the story of Dido, which, though it rises from the preceding part of the poem, has no influence upon the sequel; and, in another, by the episode of Cacus, which, without injury to the fable, might have been omitted altogether. Yet these episodes, interesting as they are to us and all mankind, because of the transcendent merit of the poetry, must have been still more interesting to the Romans, because of their connection with the Roman affairs: for the one accounts poetically for their wars with Carthage; and the other not only explains some of their religious ceremonies, but also gives a most charming rural picture of those hills and valleys in the neighbourhood of the Tiber, on which, in after times, their majestic city was fated to stand.—And if we consider, that the design of Homer's *Iliad* was, not only to show the fatal effects of dissension among confederates, but also to immortalise his country, and celebrate the most distinguished families in it, we shall be inclined to think more favourably than critics generally do, of some of his long speeches and digressions; which, though to us they may seem trivial, must have been very interesting to his countrymen, on account of the genealogies and private history recorded in them.—Shakespeare's historical plays, considered as dramatic fables, and tried by the laws of tragedy and comedy, appear very rude compositions. But if we attend to the poet's design, (as the elegant critic † has with equal truth and beauty explained it), we shall be forced to admire his judgment in the general conduct of those pieces, as well as unequalled success in the execution of particular parts.

† *Essays on the writings and genius of Shakespeare*, p. 55.

There is yet another point of view in which these digressions may be considered. If they tend to elucidate any important character, or to introduce any interesting event not otherwise within the compass of the poem, or to give an amiable display of any particular virtue, they may be intitled, not to our pardon only, but even to our admiration, however loosely they may hang upon the fable. All these three ends are effected by that most beautiful episode of Hector and Andromache in the sixth book of the *Iliad*; and the two last, by the no less beautiful one of Euryalus and Nisus, in the ninth of the *Eneid*.

15. IV. And now, from the position formerly established, that the end of this divine art is to give pleasure, it has been endeavoured to prove, that, whether in displaying the appearances of the material universe, or in imitating the workings of the human mind, and the varieties of human character, or in arranging and combining into one whole the several incidents and parts whereof his fable consists,—the aim of the poet must be, to copy nature, not as it is, but in that state of perfection in which, consistently with the particular genius of the work, and the laws of verisimilitude, it may be supposed to be.

Such, in general, is the nature of that poetry which is intended to raise admiration, pity, and other serious emotions. But in this art, as in all others, there are different degrees of excellence; and we have hitherto directed our view chiefly to the highest. All serious poets are not equally sollicitous to improve nature. Euripides is said to have represented men as they were; Sophocles, more poetically, as they should or might

be\*. Theocritus in his *Idyls*, and Spenser in his *Shepherd's Calendar*, give us language and sentiments more nearly approaching those of the *Rus verum et barbarum*†, than what we meet with in the *Pastorals* of Virgil and Pope. In the historical drama, human characters and events must be according to historical truth, or at least not so remote from it as to lead into any important misapprehension of fact. And in the historical epic poem, such as the *Pharfalla* of Lucan, and the Campaign of Addison, the historical arrangement is preferred to the poetical, as being nearer the truth. Yet nature is a little improved even in these poems. The persons in Shakespeare's historical plays, and the heroes of the *Pharfalla*, talk in verse, and suitably to their characters, and with a readiness, beauty, and harmony of expression, not to be met with in real life, nor even in history: speeches are invented, and, to heighten the description, circumstances added, with great latitude: real events are rendered more compact and more strictly dependent upon one another; and fictitious ones brought in, to elucidate human characters, and diversify the narration.

Of Poetical Arrangement, &c.  
Arist.  
† Martial.

The more poetry improves nature, by copying after general ideas collected from extensive observation, the more it partakes (according to Aristotle) of the nature of philosophy; the greater stretch of fancy and of observation it requires in the artist, and the better chance it has to be universally agreeable.

Yet poetry, when it falls short of this perfection, may have great merit as an instrument of both instruction and pleasure. To most men, simple unadorned nature is, at certain times, and in certain compositions, more agreeable than the most elaborate improvements of art; as a plain short period, without modulation, gives a pleasing variety to a discourse. Many such portraits of simple nature there are in the subordinate parts both of Homer's and of Virgil's poetry: and an excellent effect they have in giving probability to the fiction, as well as in gratifying the reader's fancy with images distinct and lively, and easily comprehended. The historical plays of Shakespeare raise not our pity and terror to such a height, as *Lear*, *Macbeth*, or *Othello*; but they interest and instruct us greatly; notwithstanding. The rudest of the eclogues of Theocritus, or even of Spenser, have by some authors been extolled above those of Virgil, because more like real life. Nay, Corneille is known to have preferred the *Pharfalla* to the *Eneid*, perhaps from its being nearer the truth, or perhaps from the sublime sentiments of Stoical morality so forcibly and so ostentatiously displayed in it.

Poets may refine upon nature too much as well as too little; for affectation and rusticity are equally remote from true elegance. The style and sentiments of comedy should no doubt be more correct and more pointed than those of the most polite conversation: but to make every footman a wit, and every gentleman and lady an epigrammatist, as Congreve has done, is an excessive and faulty refinement. The proper medium has been hit by Menander and Terence, by Shakespeare in his happier scenes, and by Garrick, Cumberland, and some others of late renown. To describe the passion of love with as little delicacy as some men speak of it, would be unpardonable; but to transform it into mere Platonic adoration, is to run into another extreme, less criminal indeed, but too remote

Of Poetical  
Language.

mote from universal truth to be universally interesting, To the former extreme Ovid inclines; and Petrarch, and his imitators, to the latter. Virgil has happily avoided both: but Milton has painted this passion, as distinct from all others, with such peculiar truth and beauty, that we cannot think Voltaire's encomium too high, when he says, that love in all other poetry seems a weakness, but in *Paradise Lost* a virtue. There are many good strokes of nature in *Ramsey's Gentle Shepherd*; but the author's passion for the *rus verum* betrays him into some indelicacies: a censure that falls with greater weight upon Theocritus, who is often absolutely innocent. The Italian pastoral of Tasso and Guarini, and the French of Fontenelle, run into the opposite extreme, (though in some parts beautifully simple), and display a system of rural manners so quaint and affected as to outrage all probability. In fine, though mediocrity of execution in poetry be allowed to deserve the doom pronounced upon it by Horace; yet is it true, notwithstanding, that in this art, as in many other good things, the point of excellence lies in a middle between two extremes; and has been reached by those only who sought to improve nature as far as the genius of their work would permit, keeping at an equal distance from rutilicity on the one hand, and affected elegance on the other.

#### SECT. VI. Of Poetical Language.

16. WORDS in poetry are chosen, first, for their *sense*; and, secondly, for their *sound*. That the first of these grounds of choice is the more excellent, nobody can deny. He who in literary matters prefers sound to sense, is a fool. Yet sound is to be attended to, even in prose; and in verse demands particular attention. We shall consider poetical language, first, as SIGNIFICANT; and, secondly, as SUSCEPTIBLE OF HARMONY.

##### § 1. Of Poetical Language, considered as SIGNIFICANT.

17. IF, as it has been endeavoured to prove, poetry be imitative of nature, poetical fictions of real events, poetical images of real appearances in the visible creation, and poetical personages of real human characters; it would seem to follow, that the *language of poetry* must be an imitation of the *language of nature*.

According to Dr Beattie†, that language is natural, when it is suited to the speaker's condition, character, and circumstances. And as, for the most part, the images and sentiments of serious poetry are copied from the images and sentiments, not of real, but of improved, nature; so the language of serious poetry must (as hinted already) be a transcript, not of the real language of nature, which is often dissipated and rude, but of natural language improved as far as may be consistent with probability, and with the supposed character of the speaker. If this be not the case, if the language of poetry be such only as we hear in conversation, or read in history, it will, instead of delight, bring disappointment: because it will fall short of what we expect from an art which is recommended rather by its pleasurable qualities, than by its intrinsic utility; and to which, in order to render it pleasing, we grant higher privileges, than to any other

kind of literary composition, or any other mode of human language.

The next inquiry must therefore be, "What are those improvements that peculiarly belong to the language of poetry?" And these may be comprehended under two heads; *poetical words*, and *tropes and figures*.

#### Art. I. Of Poetical Words.

18. One mode of improvement peculiar to poetical diction results from the use of those words, and phrases, which, because they rarely occur in prose, and frequently in verse, are by the grammarian and lexicographer termed *poetical*. In these some languages abound more than others: but no language, perhaps, is altogether without them; and perhaps no language can be so, in which any number of good poems have been written. For poetry is better remembered than prose, especially by poetical authors; who will always be apt to imitate the phraseology of those they have been accustomed to read and admire: and thus, in the works of poets, down through successive generations, certain phrases may have been conveyed, which, though originally perhaps in common use, are now confined to poetical composition. Prose-writers are not so apt to imitate one another, at least in words and phrases, both because they do not so well remember one another's phraseology, and also because their language is less artificial, and must not, if they would make it easy and flowing, (without which it cannot be elegant), depart essentially from the style of correct conversation. Poets too, on account of the greater difficulty of their numbers, have, both in the choice and in the arrangement of words, a better claim to indulgence, and stand more in need of a discretionary power.

The language of Homer differs materially from what was written and spoken in Greece in the days of Socrates. It differs in the mode of inflection, it differs in the syntax, it differs even in the words: so that one might read Homer with ease, who could not read Xenophon; or Xenophon, without being able to read Homer. Yet we cannot believe that Homer, or the first Greek poet who wrote in his style, would make choice of a dialect quite different from what was intelligible in his own time: for poets have in all ages written with a view to be read, and to be read with pleasure; which they could not be, if their diction were hard to be understood. It is more reasonable to suppose, that the language of Homer is according to some ancient dialect, which, though not perhaps in familiar use among the Greeks at the time he wrote, was however intelligible. From the Homeric to the Socratic age, a period had elapsed of no less than 400 years; during which the style both of discourse and of writing must have undergone great alterations. Yet the *Iliad* continued the standard of heroic poetry, and was considered as the very perfection of poetical language; notwithstanding that some words in it were become so antiquated, or so ambiguous, that Aristotle himself seems to have been somewhat doubtful in regard to their meaning. And if Chaucer's merit as a poet had been as great as Homer's, and the English cap. 25. tongue under Edward III. as perfect as the Greek was in the second century after the Trojan war, the style of Chaucer would probably have been our model for

† Essays,  
Part II.  
chap. II.

Of Poetical  
Words.

for poetical diction at this day; even as Petrarch, his contemporary, is still imitated by the best poets of Italy.

The rudeness of the style of Ennius has been imputed by the old critics to his having copied too closely the dialect of common life. But this appears to be a mistake. For if we compare the fragments of that author with the comedies of Plautus, who flourished in the same age, and whose language was certainly copied from that of common life, we shall be struck with an air of antiquity in the former that is not in the latter. Ennius, no doubt, like most other sublime poets, affected something of the antique in his expression; and many of his words and phrases, not adopted by any prose-writer now extant, are to be found in Lucretius and Virgil, and were by them transmitted to succeeding poets. These form part of the Roman poetical dialect; which appears from the writings of Virgil, where we have it in perfection, to have been very copious. The style of this charming poet is indeed so different from prose, and is altogether so peculiar, that it is perhaps impossible to analyse it on the common principles of Latin grammar. And yet no author can be more perspicuous or more expressive; notwithstanding the frequency of Grecism in his syntax, and his love of old words, which he, in the judgment of Quintilian, knew better than any other man how to improve into decoration\*.

\* *Instit.*  
viii. 3. § 3.

The poetical dialect of modern Italy is so different from the prosaic, that persons who can read the historians, and even speak with tolerable fluency the language of that country, may yet find it difficult to construe a page of Petrarch or Tasso. Yet it is not probable, that Petrarch, whose works are a standard of the Italian poetical diction†, made any material innovations in his native tongue. It is rather probable that he wrote it nearly as it was spoken in his time, that is, in the 14th century; omitting only harsh combinations, and taking that liberty which Homer probably, and Virgil certainly, took before him, of reviving such old, but not obsolete expressions, as seemed peculiarly significant and melodious; and polishing his style to that degree of elegance which human speech, without becoming unnatural, may admit of, and which the genius of poetry, as an art subservient to pleasure, may be thought to require.

The French poetry in general is distinguished from prose rather by the rhyme and the measure, than by any old or uncommon phraseology. Yet the French, on certain subjects, imitate the style of their old poets, of Marot in particular; and may therefore be said to have something of a poetical dialect, though far less extensive than the Italian, or even than the English. And it may be presumed, that in future ages they will have more of this dialect than they have at present. This may be inferred from the very uncommon merit of some of their late poets, particularly Boileau and La Fontaine, who, in their respective departments, will continue to be imitated, when the present modes of French prose are greatly changed: an event that, for all the pains they take to preserve their language, must inevitably happen, and whereof there are not wanting good prefaces already.

The English poetical dialect is not characterised by any peculiarities of inflection, nor by any great lati-

tude in the use of foreign idioms. More copious it is, however, than one would at first imagine; as may appear from the following specimen and observations.

(1.) A few Greek and Latin idioms are common in English poetry, which are seldom or never to be met with in prose. QUENCHED OF HOPE. Shakespeare.—SHORN OF HIS BEAMS. Milton.—*Created thing NOR VALUED HE NOR SHUN'D.* Milton.—*'Tis thus we riot, while who sow IT STARVE.* Pope.—*This day BE BREAD AND PEACE MY LOT.* Pope.—*INTO WHAT PIT THOU SEEST FROM WHAT HEIGHT FALLEN.* Milton. *He deceived The mother of mankind, WHAT TIME HIS PRIDE HAD CAST HIM OUT OF HEAVEN.* Milton.—Some of these, with others to be found in Milton, seem to have been adopted for the sake of brevity, which in the poetical tongue is indispensable. For the same reason, perhaps the articles *a* and *the* are sometimes omitted by our poets, though less frequently in serious than burlesque composition.

—In English, the adjective generally goes before the substantive, the nominative before the verb, and the active verb before (what we call) the accusative. Exceptions, however, to this rule, are not uncommon even in prose. But in poetry they are more frequent. *Their homely joys, and DESTINY OBSCURE.* *Now fades the glimmering landscape on the sight; and all the air a solemn stillness holds.* In general, that verification may be less difficult, and the cadence more uniformly pleasing; and sometimes, too, in order to give energy to expression, or vivacity to an image;—the English poet is permitted to take much greater liberties than the prose-writer, in arranging his words, and modulating his lines and periods. Examples may be seen in every page of Paradise Lost.

(2.) Some of our poetical words take an additional syllable, that they may suit the verse the better; as, *dispart, dislain, disport, affright, enchain*, for part, slain, sport, fright, chain. Others seem to be nothing else than common words made shorter, for the convenience of the versifier. Such are, *auxiliary, sub-lunar, trump, vale, part, clime, submiss, frolic, plain, drear, dread, helm, morn, mead, eve and even, gan, illum and illumine, ope, hoar, bide, swage, scape*; for auxiliary, sublunar, trumpet, valley, depart, climate, submissive, frolicsome, complain, dreary, dreadful, helmet, morning, meadow, evening, began or began to, illuminate, open, hoary, abide, alluage, escape.—Of some of these the short form is the more ancient. In Scotland, *even, morn, bide, swage*, are still in vulgar use; but *morn*, except when contradistinguished to *even*, is synonymous, not with *morning* (as in the English poetical dialect), but with *morrow*.

—The Latin poets, in a way somewhat similar, and perhaps for a similar reason, shortened *fundamentum, tutamentum, munimentum*, &c. into *fundamen, tutamen, munimen*.

(3.) Of the following words, which are now almost peculiar to poetry, the greater part are ancient, and were once no doubt in common use in England, as many of them still are in Scotland. *Afield, amain, annoy* (a noun), *anon, aye* (ever), *behest, blithe, brand* (a sword), *bridal, carol, dame* (lady), *fealty, fell* (an adjective), *gaude, gore, host* (army), *lambkin, late* (of late), *lay* (poem), *lea, glade, gleam, hurl, lore, meed, orison, plod* (to travel laboriously), *ringlet, rue*

Of Poetical  
Words.Of Poetical  
Words.

(a verb), *ruth*, *ruthless*, *sojourn* (a noun), *smite*, *speed* (an active verb), *save* (except), *spray* (twig), *stead*, *strain* (song), *strand*, *swain*, *thrall*, *thrill*, *trail* (a verb), *trall*, *trill*, *well*, *warble*, *wayward*, *woo*, *the while* (in the mean time), *yon*, *of yore*.

(4.) These that follow are also poetical; but, so far as appears, were never in common use. *Appal*, *arroyo*, *attune*, *battailous*, *breezy*, *car* (chariot), *clarion*, *cates*, *courser*, *darling*, *ficker*, *floweret*, *emblaze*, *gairish*, *circle*, *impearl*, *nightly*, *noiseless*, *pinion* (wing), *shadowy*, *sumbersome*, *streamy*, *troubulous*, *wilder* (a verb), *shrill* (a verb), *shook* (shaken), *madding*, *viewless*.—The following too derived from the Greek and Latin, seem peculiar to poetry. *Glang*, *clangor*, *choral*, *bland boreal*, *dire*, *enanguined*, *ire*, *ireful*, *lave* (to wash), *nymph* (lady, girl), *orient*, *panoply*, *philomel*, *insuriate*, *jocund*, *radiant*, *rapt*, *redolent*, *refulgent*, *verdant*, *vernal*, *zephyr*, *zone* (girdle), *zyzæan*, *zuffule*.

(5.) In most languages, the rapidity of pronunciation abbreviates some of the commonest words, or even joins two, or perhaps more, of them into one; and some of those abbreviated forms find admission in to writing. The English language was quite disfigured by them in the end of the last century; but Swift, by his satire and example, brought them into disrepute: and, though some of them be retained in conversation, as *don't*, *shan't*, *can't*, they are now avoided in solemn style; and by elegant writers in general, except where the colloquial dialect is imitated, as in comedy. 'Tis and 'twas, since the time of Shafesbury, seem to have been daily losing credit, at least in prose; but still have a place in poetry, perhaps because they contribute to conciseness. 'Twas on a lofty vase's side. Gray. 'Tis true, 'tis certain, man though dead, retains Part of himself. Pope. In verse too, *over* may be shortened into *o'er*, (which is the Scotch, and probably was the old English, pronunciation); *never* into *ne'er*; and from *the* and *to*, when they go before a word beginning with a vowel, the final letter is sometimes cut off. *O'er hills, o'er dales, o'er crags, o'er rocks they go.* Pope. *Where'er she turns, the Graces homage pay. And all that beauty, all that wealth o'er gaze. Rich with the spoils of time did ne'er unroll.* Gray. *T' alarm th' eternal midnight of the grave.*—

These abbreviations are now peculiar to the poetical tongue, but not necessary to it. They sometimes promote brevity, and render versification less difficult.

(6.) Those words which are commonly called *compound epithets*, as *rosy-finger'd*, *rosy bosom'd*, *many-twinkling*, *many-sounding*, *mosh-grown*, *bright-eyed*, *straw-built*, *spirit-stirring*, *incense-breathing*, *heaven-taught*, *love-whispering*, *late-resounding*, are also to be considered as part of our poetical dialect. It is true, we have compounded adjectives in familiar use, as *high-seasoned*, *well-natured*, *ill-bred*, and innumerable others. But we speak of those that are less common, that seldom occur except in poetry, and of which in prose the use would appear affected. And that they sometimes promote brevity and vivacity of expression, cannot be denied. But, as they give, when too frequent, a stiff and finical air to a performance; as they are not always explicit in the sense, nor agreeable in

the sound; as they are apt to produce a confusion, or too great a multiplicity, of images; as they tend to disfigure the language, and furnish a pretext for endless innovation; they ought to be used sparingly; and those only used, which the practice of popular authors has rendered familiar to the ear, and which are in themselves peculiar emphatical and harmonious.

(7.) In the transformation of nouns into verbs and participles, our poetical dialect admits of greater latitude than prose. Hymn, pillow, curtain, story, pillar, picture, peal, surge, cavern, honey, career, cincture, bosom, sphere, are common nouns; but to hymn, to pillow, to curtain, to pillar, to picture, to peal, to surge, to cavern, to honey, to career, to cincture, to bosom, to sphere, would appear affected in prose, though in verse they are warranted by the very best authority.

Some late poets, particularly the imitators of Spenser, have introduced a great variety of uncommon words, as *certes*, *efisoons*, *ne*, *whilom*, *transfew*, *moil*, *fone*, *lofel*, *albe*, *hight*, *dight*, *pight*, *thews*, *couthful*, *aflost*, *muchel*, *wend*, *arrear*, &c. These were once poetical words, no doubt; but they are now obsolete, and to many readers unintelligible. No man of the present age, however conversant in this dialect, would naturally express himself in it on any interesting emergency; or, supposing this natural to the antiquarian, it would never appear so to the common hearer or reader. A mixture of these words, therefore, must ruin the pathos of modern language; and as they are not familiar to our ear, and plainly appear to be fought after and affected, will generally give a stiffness to modern versification. Yet in subjects approaching to the ludicrous they may have a good effect; as in the *Schoolmistress* of Shenstone, Parnel's Fairy-tale, Thomson's Cattle of Indolence, and Pope's lines in the *Dunciad* upon Wormius. But this effect will be most pleasing to those who have least occasion to recur to the glossary.

Indeed, it is not always easy to fix the boundary between poetical and obsolete expressions. To many readers, *lore*, *meed*, *behest*, *blithe*, *gaude*, *spray*, *thrall*, may already appear antiquated; and to some the style of Spenser, or even of Chaucer, may be as intelligible as that of Dryden. This however we may venture to affirm, that a word, which the majority of readers cannot understand without a glossary, may with reason be considered as obsolete; and ought not to be used in modern composition, unless revived, and recommended to the public ear, by some very eminent writer. There are but few words in Milton, as *nathless*, *time*, *frore*, *bosky*, &c.; there are but one or two in Dryden, as *falsify* (v); and in Pope, there are none at all, which every reader of our poetry may not be supposed to understand; whereas in Shakespeare there are many, and in Spenser many more, for which one who knows English very well may be obliged to consult the dictionary. The practice of Milton, Dryden, or Pope, may therefore, in almost all cases, be admitted as good authority for the use of a poetical word. And in them, all the words above enumerated, as poetical, and in present use, may actually be found. And of such poets as may choose to observe

this

(n) Dryden in one place (*Æneid* ix. vers. 1095.) uses *Falsified* to denote *Pierced through and through*. He acknowledges, that this use of the word is an innovation; and has nothing to plead for it but his own authority, and that *Falsare* in Italian sometimes means the same thing.

Of Poetical this rule, it will not be said, either that they reject the judgment of Quintilian, who recommends the newness of the old words, and the oldest of the new, or that they are inattentive to Pope's precept;

Be not the first by whom the new are tried.  
Nor yet the last to lay the old aside.

*Eff. on Crit. v. 335.*

We must not suppose, that these poetical words never occur at all except in poetry. Even from conversation they are not excluded: and the ancient critics allow, that they may be admitted into prose; where they occasionally confer dignity upon a sublime subject, or heighten the ludicrous qualities of a mean one. But it is in poetry only, where the frequent use of them does not favour of affectation.

Nor must we suppose them essential to this art. Many passages there are of exquisite poetry, wherein not a single phrase occurs that might not be used in prose. In fact, the influence of these words in adorning English verse is not very extensive. Some influence however they have. They serve to render the poetical style, first, more melodious; and, secondly, more solemn.

First, They render the poetical style more melodious, and more easily reducible into measure. Words of unwieldy size, or difficult pronunciation, are never used by correct poets, where they can be avoided: unless in their found they have something imitative of the sense. Homer's poetical inflections contribute wonderfully to the sweetness of his numbers: and if the reader is pleased to look back to the specimen above given of the English poetical dialect, he will find that the words are in general well-sounding, and such as may coalesce with other words, without producing harsh combinations. Quintilian observes, that poets, for the sake of their verse, are indulged in many liberties, not granted to the orator, of lengthening, shortening, and dividing their words\*:—and if the Greek and Roman poets claimed this indulgence from necessity, and obtained it, the English, those of them especially who write in rhyme, may claim it with better reason; as the words of their language are less musical, and far less susceptible of variety in arrangement and syntax.

Secondly, Such poetical words as are known to be ancient have something venerable in their appearance, and impart a solemnity to all around them. This remark is from Quintilian; who adds, that they give to a composition that cast and colour of antiquity, which in painting is so highly valued, but which art can never effectually imitate†. Poetical words that are either not ancient, or not known to be such, have, however, a pleasing effect from association. We are accustomed to meet with them in sublime and elegant writing; and hence they come to acquire sublimity and elegance: Even as the words we hear on familiar occasions come to be accounted familiar; and as those that take their rise among pick-pockets, gamblers, and gypsies, are thought too indelicate to be used by any person of taste or good-manners. When one hears the following lines, which abound in poetical words,

The breezy call of incense-breathing morn,  
The swallow twittering from the straw-built shed,

The cock's shrill clarion, or the echoing horn,  
No more shall rouse them from their lowly bed:

—one is as sensible of the dignity of the language; as one would be of the vileness or vulgarity of that man's speech, who should prove his acquaintance with Bridewell, by interlarding his discourse with such terms as *mill-doll*, *queer cull*, or *rubbing cheat* †; or who, in imitation of fops and gamblers, should, on the common occasions of life, talk of being *beat hollow*, or *saving his distance* ‡.—What gives dignity to persons, gives dignity to language. A man of this character is one who has borne important employments, been connected with honourable associates, and never degraded himself by levity or immorality of conduct. Dignified phrases are those which have been used to express elevated sentiments, have always made their appearance in elegant composition, and have never been profaned by giving permanency or utterance to the passions of the vile, the giddy, or the worthless. And as by an active old age, the dignity of such men is confirmed and heightened; so the dignity of such words, if they be not suffered to fall into disuse, seldom fails to improve by length of time.

#### Art 2. Of Tropes and Figures.

19. If it appear, that, by means of figures, language may be made more *pleasing*, and more *natural*, than it would be without them; it will follow, that to poetic language, whose end is to *please* by imitating *nature*, figures must be not only ornamental, but necessary. It will here be proper, therefore, first to point out the importance and utility of figurative language; secondly, to show, that figures are more necessary to poetry in general, than to any other mode of writing.

I. *As to the importance and utility of figurative expression*, in making language more pleasing and more natural; it may be remarked,

(1.) That tropes and figures are often necessary to supply the unavoidable defects of language. When proper words are wanting, or not recollected, or when we do not choose to be always repeating them, we must have recourse to tropes and figures.—When philosophers began to explain the operations of the mind, they found, that most of the words in common use, being framed to answer the more obvious exigencies of life, were in their proper signification applicable to matter only and its qualities. What was to be done in this case? Would they think of making a new language to express the qualities of mind? No: that would have been difficult, or impracticable; and granting it both practicable and easy, they must have foreseen, that nobody would read or listen to what was thus spoken or written, in a new, and consequently in an unknown, tongue. They therefore took the language as they found it; and, wherever they thought there was a similarity or analogy between the qualities of the mind and the qualities of matter, scrupled not to use the names of the material qualities tropically, by applying them to the mental qualities. Hence came the phrases, *solidity* of judgment, *avarice* of imagination, *enlargement* of understanding, and many others; which, though figurative, express the meaning just as well as proper words would have done.

\* *Instit.*

cap. 1. § 3.

† *Lib. 8.*  
cap. 3. § 3.

Of Tropes  
and FiguresOf Tropes  
and Figures

In fact, numerous as the words in every language are, they must always fall short of the unbounded variety of human thoughts and perceptions. Tastes and smells are almost as numerous as the species of bodies. Sounds admit of perceptible varieties that surpass all computation, and the seven primary colours may be diversified without end. If each variety of external perception were to have a name, language would be insurmountably difficult; nay, if men were to appropriate a class of names to each particular sense, they would multiply words exceedingly, without adding any thing to the clearness of speech. Those words, therefore, that in their proper signification denote the objects of one sense, we often apply tropically to the objects of another, and say, Sweet taste, sweet smell, sweet sound; sharp point, sharp taste, sharp sound; harmony of sounds, harmony of colours, harmony of parts; soft silk, soft colour, soft sound, soft temper; and so in a thousand instances: and yet these words, in their tropical signification, are not less intelligible than in their proper one; for sharp taste and sharp sound, are as expressive as sharp sword; and harmony of tones is not better understood by the musician, than harmony of parts by the architect, and harmony of colours by the painter.

Savages, illiterate persons, and children, have comparatively but few words in proportion to the things they may have occasion to speak of; and must therefore recur to tropes and figures more frequently, than persons of copious elocution. A seaman, or mechanic, even when he talks of that which does not belong to his art, borrows his language from that which does; and this makes his diction figurative to a degree that is sometimes entertaining enough. "Death (says a seaman in one of Smollet's novels) has not yet boarded my comrade; but they have been yard-arm and yard-arm these three glasses. His starboard eye is open, but salt jammed in his head; and the baulkards of his under jaw have given way." These phrases are exaggerated; but we allow them to be natural, because we know that illiterate people are apt to make use of tropes and figures taken from their own trade, even when they speak of things that are very remote and incongruous. In those poems, therefore, that imitate the conversation of illiterate persons, as in comedy, farce, and pastoral, such figures judiciously applied may render the imitation more pleasing, because more exact and natural.

Words that are untuneable and harsh, the poet is often obliged to avoid, when perhaps he has no other way to express their meaning than by tropes and figures; and sometimes the measure of his verse may oblige him to reject a proper word that is not harsh, merely on account of its being too long, or too short, or in any other way unsuitable to the rhythm, or to the rhyme. And hence another use of figurative language, that it contributes to poetical harmony. Thus, *to press the plain* is frequently used to signify *to be slain in battle*; *liquid plain* is put for *ocean*, *blue serene* for *sky*, and *silvan reign* for *country life*.

(2.) Tropes and figures are favourable to delicacy. When the proper name of a thing is in any respect unpleasant, a well-chosen trope will convey the idea in such a way as to give no offence. This is agreeable, and even necessary, in polite conversation, and cannot

be dispensed with in elegant writing of any kind. Many words, from their being often applied to vulgar use, acquire a meanness that disqualifies them for a place in serious poetry; while perhaps, under the influence of a different system of manners, the corresponding words in another language may be elegant, or at least not vulgar. When one reads Homer in the Greek, one takes no offence at his calling Eumeus by a name which, literally rendered, signifies *swine-herd*; first, because the Greek word is well-sounding in itself; secondly, because we have never heard it pronounced in conversation, nor consequently debased by vulgar use; and, thirdly, because we know, that the office denoted by it was, in the age of Eumeus, both important and honourable. But Pope would have been blamed, if a name so indelicate as *swine-herd*, had in his translation been applied to so eminent a personage; and therefore he judiciously makes use of the trope *synecdoche*, and calls him *swain* †; † *Odyss.* a word both elegant and poetical, and not likely to lead the reader into any mistake about the person spoken of, as his employment had been described in a preceding passage. The same Eumeus is said, in the simple but melodious language of the original, to have been making his own shoes when Ulysses came to his door; a work which in those days the greatest heroes would often find necessary. This too the translator softens by a tropical expression?

Here sat Eumeus, and his cares applied.

To form strong *bushins* of well-season'd hide.

A hundred other examples might be quoted from this translation; but these will explain our meaning.

There are other occasions, on which the delicacy of figurative language is still more needful: as in Virgil's account of the effects of animal-love, and of the plague among the beasts, in the third Georgic; where Dryden's style, by being less figurative than the original, is in one place exceedingly filthy, and in another shockingly obscene.

Hobbes could construe a Greek author; but his skill in words must have been all derived from the dictionary: for he seems not to have known, that any one articulate sound could be more agreeable, or any one phrase more dignified, than any other. In his Iliad and Odyssey, even when he hits the author's sense (which is not always the case), he proves, by his choice of words, that of harmony, elegance, or energy of style, he had no manner of conception. And hence that work, though called a *Translation of Homer*, does not even deserve the name of *poem*; because it is in every respect unpleasant, being nothing more than a fictitious narrative delivered in a mean prose, with the additional meanness of harsh rhyme, and untuneable measure.—Trapp understood Virgil well enough as a grammarian, and had a taste for his beauties: yet his translation bears no resemblance to Virgil; which is owing to the same cause, an imprudent choice of words and figures, and a total want of harmony.

The delicacy we here contend for, may indeed, both in conversation and in writing, be carried too far. To call *killing an innocent man in a duel* an affair of honour, and a *violation of the rights of wedlock* an affair of gallantry, is a prostitution of figurative language.

Nor

Nor is it any credit to us, that we are said to have upwards of 40 figurative phrases to denote excessive drinking. Language of this sort generally implies, that the public abhorrence of such crimes is not so strong as it ought to be; and it is a question, whether even our morals might not be improved, if we were to call these and such like crimes by their proper names, *murder, adultery, drunkenness, gluttony*; names, that not only express our meaning, but also betoken our disapprobation.—As to writing, it cannot be denied, that even Pope himself, in the excellent version just now quoted, has sometimes, for the sake of his numbers, or for fear of giving offence by too close an imitation of Homer's simplicity, employed tropes and figures too quaint or too solemn for the occasion. And the finical style is in part characterised by the writer's dislike to literal expressions, and affectedly substituting in their stead unnecessary tropes and figures. With these authors, a man's only child must always be his *only hope*; a country-maid becomes a *rural beauty*, or perhaps a *nymph of the groves*; if flattery sing at all, it must be a *green song*; the shepherd's flute dwindles into an *oaten reed*, and his crook is exalted into a *sceptre*; the *silver lilies* rise from their *golden beds*, and *languish* to the complaining gale. A young woman, though a good Christian, cannot make herself agreeable without *sacrificing to the Graces*; nor hope to do any execution among the *gentle swains*, till a whole legion of *Cupids*, armed with *flames and darts*, and other weapons, begin to discharge from her eyes their formidable artillery. For the sake of variety, or of the verse, some of these figures may now and then find a place in a poem; but in prose, unless very sparingly used, they favour of affectation.

(3.) Tropes and figures promote brevity; and brevity, united with perspicuity, is always agreeable. An example or two will be given in the next paragraph. Sentiments thus delivered, and imagery thus painted, are readily apprehended by the mind, make a strong impression upon the fancy, and remain long in the memory; whereas too many words, even when the meaning is good, never fail to bring disgust and weariness. They argue a debility of mind which hinders the author from seeing his thoughts in one distinct point of view; and they also encourage a suspicion, that there is something faulty or defective in the matter. In the poetic style, therefore, which is addressed to the fancy and passions, and intended to make a vivid, a pleasing, and a permanent impression, brevity, and consequently tropes and figures are indispensable. And a language will always be the better suited to poetical purposes, the more it admits of this brevity;—a character which is more conspicuous in the Greek and Latin than in any modern tongue, and much less in the French than in the Italian or English.

(4.) Tropes and figures contribute to strength or energy of language, not only by their conciseness, but also by conveying to the fancy ideas that are easily comprehended, and make a strong impression. We are powerfully affected with what we see, or feel, or hear. When a sentiment comes enforced or illustrated by figures taken from objects of sight, or touch, or hearing, one thinks, as it were, that one sees, or feels, or hears, the thing spoken of; and thus, what in itself would perhaps be obscure, or is merely intel-

lectual, may be made to seize our attention and interest our passions almost as effectually as if it were an object of outward sense. When Virgil calls the Scipios *thunderbolts of war*, he very strongly expresses in one word, and by one image, the rapidity of their victories, the noise their achievements made in the world, and the ruin and conflagration that attended their irresistible career.—When Homer calls Ajax *the bulwark of the Greeks*, he paints with equal brevity his vast size and strength, the difficulty of prevailing against him, and the confidence wherewith his countrymen reposed on his valour.—When Solomon says of the strange woman, or harlot, that “her feet go down to death,” he lets us know, not only that her path ends in destruction, but also, that they who accompany her will find it easy to go forwards to ruin, and difficult to return to their duty.—Satan's enormous magnitude, and resplendent appearance, his perpendicular ascent thro' a region of darkness, and the inconceivable rapidity of his motion, are all painted out to our fancy by Milton, in one very short simile, to

Sprung upward, like—a pyramid of fire.

Par. Lost, b. 4. v. 1013.

To take in the full meaning of which figure, we must imagine ourselves in chaos, and a vast luminous body rising upward, near the place where we are, too swiftly as to appear a continued track of light, and lessening to the view according to the increase of distance, till it end in a point, and then disappear; and all this must be supposed to strike our eye at one instant.—Equal to this in propriety, tho' not in magnificence, is that allegory of Gray,

The paths of glory lead but to the grave:

Which presents to the imagination a wide plain, where several roads appear, crowded with glittering multitudes, and issuing from different quarters, but drawing nearer and nearer as they advance, till they terminate in the dark and narrow house, where all their glories enter in succession, and disappear for ever.—When it is said in Scripture, of a good man who died, that he *fell asleep*, what a number of ideas are at once conveyed to our imagination, by this beautiful and expressive figure! As a labourer, at the close of day, goes to sleep, with the satisfaction of having performed his work, and with the agreeable hope of awaking in the morning of a new day, refreshed and cheerful; so a good man, at the end of life, resigns himself calm and contented to the will of his Maker, with the sweet reflection of having endeavoured to do his duty, and with the transporting hope of soon awaking in the regions of light, to life and happiness eternal. The figure also suggests, that to a good man the transition from life to death is, even in the sensation, no more painful, than when our faculties melt away into the pleasing insensibility of sleep.—Satan, flying among the stars, is said by Milton to “*sail between worlds and worlds*,” which has an elegance and force far superior to the proper word *fly*. For by this allusion to a ship, we are made to form a lively idea of his great size, and to conceive of his motion, that it was equable and majestic.—Virgil uses a happy figure to express the size of the great wooden horse, by means of which the Greeks were conveyed into Troy: “*Equum divina*

Pal-

Of Tropes and Figures Palladis arte adificavit."—Milton is still bolder when he says,

Who would not sing for Lycidas? he knew  
Himself to sing, and build the lofty rhyme.

The phrase, however, though bold, is emphatical; and gives a noble idea of the durability of poetry, as well as of the art and attention requisite to form a good poem.—There are hundreds of tropical expressions in common use, incomparably more energetic than any proper words of equal brevity that could be put in their place. A cheek burning with blushes, is a trope which at once describes the colour as it appears to the beholder, and the glowing heat as it is felt by the person blushing. *Chilled* with dependence, *petrified* with astonishment, *thunderstruck* with disagreeable and unexpected intelligence, *melted* with love or pity, *dissolved* in luxury, *hardened* in wickedness, *softening* into remorse, *inflamed* with desire, *tossed* with uncertainty, &c.—every one is sensible of the force of these and the like phrases, and that they must contribute to the energy of composition.

(5.) Tropes and figures promote strength of expression; and are in poetry peculiarly requisite, because they are often more *natural*, and more *imitative*, than proper words. In fact, this is so much the case, that it would be impossible to imitate the language of passion without them. It is true, that when the mind is agitated, one does not run out into allegories, or long-winded similitudes, or any of the figures that require much attention and many words, or that tend to withdraw the fancy from the object of the passion. Yet the language of many passions must be figurative, notwithstanding; because they rouse the fancy, and direct it to objects congenial to their own nature, which diversify the language of the speaker with a multitude of allusions. The fancy of a very angry man, for example, presents to his view a train of disagreeable ideas connected with the passion of anger, and tending to encourage it; and if he speak without restraint during the paroxysm of his rage, those ideas will force themselves upon him, and compel him to give them utterance. "Infernal monster! (he will say),—my blood boils at him; he has used me like a dog; never was man so injured as I have been by this barbarian. He has no more sense of propriety than a stone. His countenance is diabolical, and his soul as ugly as his countenance. His heart is cold and hard, and his resolutions dark and bloody," &c. This speech is wholly figurative. It is made up of *metaphors* and *hyperboles*, which, with the *proposopoeia* and *apostrophe*, are the most passionate of all the figures. Lear, driven out of doors by his unnatural daughters, in the midst of darkness, thunder, and tempest, naturally breaks forth (for his indignation is just now raised to the very highest pitch) into the following violent exclamation against the crimes of mankind, in which almost every word is figurative.

Tremble, thou wretch,  
That hast within thee undivulged crimes  
Unwhipt of justice. Hide thee, thou bloody hand,  
Thou perjur'd, and thou simular of virtue,  
That art incestuous. Calistiff, to pieces shake,  
That under covert, and convenient seeming,

Hast practis'd on man's life. Close pent-up guilts,  
Rive your concealing continents, and cry  
These dreadful summoners grace. *King Lear.*

—The vehemence of maternal love, and sorrow from the apprehension of losing her child, make the Lady Constance utter a language that is strongly figurative, though quite suitable to the condition and character of the speaker. The passage is too long for a quotation, but concludes thus:

O Lord! my boy, my Arthur, my fair son,  
My life, my joy, my food, my all the world,  
My widow-comfort, and my sorrow's cure. *King John.*

—Similar to this, and equally expressive of conjugal love, is that beautiful hyperbole in Homer; where Andromache, to dissuade her husband from going out to the battle, tells him, that she had now no mother, father, or brethren, all her kindred being dead, and her native country desolate; and then tenderly adds,

But while my Hector yet survives, I see  
My father, mother, brethren, all in thee. *Iliad*, b. 6.

As the passions that agitate the soul, and rouse the fancy, are apt to vent themselves in tropes and figures, so those that depress the mind adopt for the most part a plain diction without any ornament. For to a dejected mind, wherein the imagination is generally inactive, it is not probable that any great variety of ideas will present themselves; and when these are few and familiar, the words that express them must be simple. As no author equals Shakespeare in boldness or variety of figures, when he copies the style of those violent passions that stimulate the fancy; so, when he would exhibit the human mind in a dejected state, no uninspired writer excels him in simplicity. The same Lear whose resentment had impaired his understanding, while it broke out in the most boisterous language, when, after some medical applications, he recovers his reason, his rage being now exhausted, his pride humbled, and his spirits totally depressed, speaks in a style than which nothing can be imagined more simple, or more affecting:

Pray, do not mock me;  
I am a very foolish, fond old man,  
Fourscore and upward, and, to deal plainly with you,  
I fear I am not in my perfect mind.  
Methinks I should know you, and know this man;  
Yet I am doubtful: for I am mainly ignorant  
What place this is; and all the skill I have  
Remembers not these garments: nor I know not  
Where I did lodge last night.— *LEAR*, *act* 4. *sc.* 7.

—Desdemona, ever gentle, artless, and sincere, shocked at the unkindness of her husband, and overcome with melancholy, speaks in a style so beautifully simple, and so perfectly natural, that one knows not what to say in commendation of it:

My mother had a maid call'd Barbara;  
She was in love, and he the lov'd prov'd mad,  
And did forsake her. She had a song of willow;  
An old thing it was, but it express'd her fortune,  
And she died singing it. That long-to-night  
Will not go from my mind; I have much to do,  
But to go hang my head all at one side,

And

And sing it like poor Barbara. OTHELLO, *act 4. sc. 3.*

Away, thou rag, thou quantity, thou remnant!

*Taming of the Shrew, act 4. sc. 1.*

Sometimes the imagination, even when exerted to the utmost, takes in but few ideas. This happens when the attention is totally engrossed by some very great object; admiration being one of those emotions that rather suspend the exercise of the faculties, than push them into action. And here, too, the simplest language is the most natural; as when Milton says of the Deity, that he sits "high-thron'd above all height." And as this simplicity is more suitable to that one great exertion which occupies the speaker's mind, than a more elaborate imagery or language would have been; so has it also a more powerful effect in fixing and elevating the imagination of the hearer: for, to introduce other thoughts for the sake of illustrating what cannot be illustrated, could answer no other purpose than to draw off the attention from the principal idea. In these and the like cases, the fancy left to itself will have more satisfaction in pursuing at leisure its own speculations, than in attending to those of others; as they who see for the first time some admirable object, would choose rather to feast upon it in silence, than to have their thoughts interrupted by a long description from another person, informing them of nothing but what they see before them, are already acquainted with, or may easily conceive.

It was remarked above, that the *hyperbole*, *prosopeia*, and *apostrophe*, are among the most passionate figures. This deserves illustration.

1<sup>st</sup>, A very angry man is apt to think the injury he has just received, greater than it really is; and, if he proceed immediately to retaliate by word or deed, seldom fails to exceed the due bounds, and to become injurious in his turn. The fond parent looks upon his child as a prodigy of genius and beauty; and the romantic lover will not be persuaded that his mistress has nothing supernatural either in her mind or person. Fear, in like manner, not only magnifies its object when real, but even forms an object out of nothing, and mistakes the fictions of fancy for the intimations of sense.—No wonder then, that they who speak according to the impulse of passion, should speak *hyperbolically*; that the angry man should exaggerate the injury he has received, and the vengeance he is going to inflict; that the sorrowful should magnify what they have lost, and the joyful what they have obtained; that the lover should speak extravagantly of the beauty of his mistress, the coward of the dangers he has encountered, and the credulous clown of the miracles performed by the juggler. In fact, these people would not do justice to what they feel, if they did not say more than the truth. The valiant man, on the other hand, as naturally adopts the diminishing hyperbole when he speaks of danger; and the man of sense, when he is obliged to mention his own virtue or ability; because it appears to him, or he is willing to consider it, as less than the truth, or at best as inconsiderable. Contempt uses the same figure; and therefore Petruccio, affecting that passion, affects also the language of it:

Thou liest, thou thread, thou thimble,  
Thou yard, three-quarters, half-yard, quarter, nail,  
Thou flea, thou nit, thou winter-cricket, thou!  
Brav'd in mine own house with a skin of thread!

For some passions consider their objects as important, and others as unimportant. Of the former sort are anger, love, fear, admiration, joy, sorrow, pride; of the latter are contempt and courage. Those may be said to subdue the mind to the object; and these, to subdue the object to the mind. And the former, when violent, always magnify their objects; whence the hyperbole called amplification, or *auxesis*: and the latter as constantly diminish theirs, and give rise to the hyperbole called *meiosis*, or diminution.—Even when the mind cannot be said to be under the influence of any violent passion, we naturally employ the same figure, when we would express another very strongly with any idea. He is a walking shadow; he is worn to skin and bone; he has one foot in the grave, and the other following—these, and the like phrases, are proved to be natural by their frequency. By introducing great ideas, the hyperbole is further useful in poetry, as a source of the sublime; but when employed injudiciously, is very apt to become ridiculous. Cowley makes Goliath as big as the hill down which he was marching; and tells us, that when he came <sup>Davidic</sup> into the valley, he seemed to fill it, and to overtop <sup>b. 3.</sup>

the neighbouring mountains, (which, by the by, seems rather to lessen the mountains and valleys, than to magnify the giant); nay, he adds, that the sun started back when he saw the splendour of his arms. This poet seems to have thought, that the figure in question could never be sufficiently enormous; but Quintilian would have taught him, "*Quamvis omnis hyperbole ultra fidem, non tamen esse debet ultra modum.*" The reason is, that this figure, when excessive, betokens rather absolute insatiation, than intense emotion; and resembles the efforts of a ranting tragedian, or the ravings of an enthusiastic declaimer, who, by putting on the gestures and looks of a lunatic, satisfy the discerning part of their audience, that, instead of feeling strongly, they have no rational feelings at all. In the wildest energies of nature, there is a modesty, which the imitative artist will be careful never to overstep.

2<sup>dly</sup>, That figure, by which things are spoken of as if they were persons, is called *prosopeia*, or *personification*. It is a bold figure, and yet is often natural. Long acquaintance recommends to some share in our affection even things inanimate, as a house, a tree, a rock, a mountain, a country; and were we to leave such a thing, without hope of return, we should be inclined to address it with a farewell, as if it were a perceptive creature. Nay, we find that ignorant nations have actually worshipped such things, or considered them as the haunt of certain powerful beings. Dryads and Hamadryads were by the Greeks and Romans supposed to preside over trees and groves; river-gods and nymphs, over streams and fountains; little deities, called *Lares* and *Penates*, were believed to be the guardians of hearths and houses. In Scotland there is hardly a hill remarkable for the beauty of its shape, that was not in former times thought to be the habitation of fairies. Nay, modern as well as ancient superstition has appropriated the waters to a peculiar sort of demon or goblin, and peopled the very regions of death,

death, the tombs and charnel-houses, with multitudes of gholls and phantoms.—Besides, when things inanimate make a strong impression upon us, whether agreeable or otherwise, we are apt to address them in terms of affection or dislike. The sailor blesses the plank that brought him ashore from the shipwreck; and the passionate man, and sometimes even the philosopher, will say bitter words to the stumbling-block that gave him a fall.—Moreover, a man agitated with any interesting passion, especially of long continuance, is apt to fancy that all nature sympathizes with him. If he has lost a beloved friend, he thinks the sun less bright than at other times; and in the sighing of the winds and groves, in the lowings of the herd, and in the murmurs of the stream, he seems to hear the voice of lamentation. But when joy or hope predominate, the whole world assumes a gay appearance. In the contemplation of every part of nature, of every condition of mankind, of every form of human society, the benevolent and the pious man, the morose and the cheerful, the miser and the misanthrope, finds occasion to indulge his favourite passion, and sees, or thinks he sees, his own temper reflected back in the actions, sympathies, and tendencies of other things and persons. Our affections are indeed the medium through which we may be said to survey ourselves, and every thing else; and whatever be our inward frame, we are apt to perceive a wonderful congeniality in the world without us. And hence, the fancy, when roused by real emotions, or by the pathos of composition, is easily reconciled to those figures of speech that ascribe sympathy, perception, and the other attributes of animal life, to things inanimate, or even to notions merely intellectual.—Motion, too, bears a close affinity to action, and affects our imagination nearly in the same manner; and we see a great part of nature in motion, and by their sensible effects are led to contemplate energies innumerable. These conduct the rational mind to the Great First Cause; and these, in times of ignorance, disposed the vulgar to believe in a variety of subordinate agents employed in producing those appearances that could not otherwise be accounted for. Hence an endless train of fabulous deities, and of witches, demons, fairies, genii; which, if they prove our reason weak and our fancy strong, prove also, that personification is natural to the human mind; and that a right use of this figure may have a powerful effect, in fabulous writing especially, to engage our sympathy in behalf of things as well as persons: for nothing can give lasting delight to a moral being, but that which awakens sympathy, and touches the heart; and though it be true, that we sympathize in some degree even with inanimate things, yet what has, or is supposed to have, life, calls forth a more sincere and more permanent fellow-feeling.—Let it be observed further, that to awaken our sympathetic feelings, a lively conception of their object is necessary. This indeed is true of almost all our emotions; their keenness is in proportion to the vivacity of the perceptions that excite them. Distress that we see, is more affecting than what we only hear of\*; a perusal of the gayest scenes in a comedy does not rouse the mind so effectually, as the presence of a cheerful companion; and the death of a friend is of greater energy in producing seriousness, and the consideration of our latter end, than all the pathos of Young. Of descriptions ad-

dressed to the fancy, those that are most vivid and picturesque will generally be found to have the most powerful influence over our affections; and those that exhibit persons engaged in action, and adorned with visible insignia, give a brisker impulse to the faculties, that such as convey intellectual ideas only, or images taken from still life. No abstract notion of time, or of love, can be so striking to the fancy, as the image of an old man accoutred with a scythe, or of a beautiful boy with wings and a bow and arrows: and no physiological account of frenzy could suggest so vivid an idea, as the poet has given us in that exquisite portrait,

And moody madness laughing wild, amid feverish woe

And for this reason partly it is, that the epic poet, in order to work the more effectually upon our passions and imagination, refers the secret springs of human conduct, and the vicissitudes of human affairs, to the agency of personified causes; that is, to the machinery of gods and goddesses, angels, demons, magicians, and other powerful beings. And hence, in all sublime poetry, life and motion, with their several modes and attributes, are liberally bestowed on those objects where-with the author intends that we should be strongly impressed: scenes perfectly inanimate, and still, tending rather to diffuse a languor over the mind, than to communicate to our internal powers those lively energies, without which a being essentially active can never receive complete gratification.—Lastly, some violent passions are peculiarly inclined to change things into persons. The horrors of his mind haunted Orestes in the shape of furies. Conscience, in the form of the murdered person, stares the murderer in the face, and often terrifies him to distraction. The superstitious man, travelling alone in the dark, mistakes a white stone for a ghost, a bush for a demon, a tree waving with the wind for an enormous giant brandishing a hundred arms. The lunatic and enthusiast converse with persons who exist only in their own distempered fancy: and the glutton, and the miser, if they were to give utterance to all their thoughts, would often, it is presumable, speak, the one of his gold, the other of his belly, not only as a person, but as a god,—the object of his warmest love and most devout regard.—More need not be said to prove, that personification is natural, and may frequently contribute to the pathos, energy, and beauty of poetic language.

3dly, *Apophrophe*, or a sudden diversion of speech from one person to another person or thing, is a figure nearly related to the former. Poets sometimes make use of it, in order to help out their verse, or merely to give variety to their style: but on those occasions it is to be considered as rather a trick of art, than an effort of nature. It is most natural, and most pathetic, when the person or thing to whom the apophrophe is made, and for whose sake we give a new direction to our speech, is in our eyes eminently distinguished for good or evil, or raises within us some sudden and powerful emotion, such as the hearer would acquiesce in, or at least acknowledge to be reasonable. But this, like the other pathetic figures, must be used with great prudence. For if, instead of calling forth the hearer's sympathy, it should only betray the levity of the speaker, or such wanderings of his mind as neither the subject nor the occasion would lead one to expect, it will then

\* *Hor. Art. 1.*  
*Act. v. 190.*

Of Tropes  
and Figures.Of Tropes  
and Figures.

then create disgust, instead of approbation.—The orator, therefore, must not attempt the passionate apostrophe, till the minds of the hearers be prepared to join in it. And every audience is not equally obsequious in this respect. In the forum of ancient Rome that would have passed for sublime and pathetic, which in the most respectable British auditories would appear ridiculous. For our style of public speaking is cool and argumentative; and partakes less of enthusiasm than the Roman did, and much less than the modern French or Italian. Of British eloquence, particularly that of the pulpit, the chief recommendations are gravity and simplicity. And it is vain to say, that our oratory ought to be more vehement: for that matter depends on causes, which it is not only inexpedient, but impossible to alter; namely, on the character and spirit of the people, and their rational notions in regard to religion, policy, and literature. The exclamations of Cicero would weigh but little in our parliament; and many of those which we meet with in French sermons would not be more effectual if attempted in our pulpit. To see one of our preachers, who the moment before was a cool reasoner, a temperate speaker, an humble Christian, and an orthodox divine, break out into a sudden apostrophe to the immortal powers, or to the walls of the church, tends to force a smile, rather than a tear, from those among us who reflect, that there is nothing in the subject, and should be nothing in the orator, to warrant such wanderings of fancy, or vehemence of emotion. If he be careful to cultivate a pure style, and a grave and graceful utterance, a British clergyman, who speaks from conviction the plain unaffected words of truth and soberness, of benevolence and piety, will, it is believed, convey more pathetic, as well as more permanent, impressions to the heart, and be more useful as a Christian teacher, than if he were to put in practice all the attitudes of Roscius, and all the topos and figures of Cicero.

But where the language of passion and enthusiasm is permitted to display itself, whatever raises any strong emotion, whether it be animated or inanimate, absent or present, sensible or intellectual, may give rise to the apostrophe. A man in a distant country, speaking of the place of his birth, might naturally exclaim, “O my dear native land, shall I never see thee more!” Or, when some great misfortune befalls him, “Happy are ye, O my parents, that ye are not alive to see this.”—We have a beautiful apostrophe in the third book of the *Eneid*, where *Eneas*, who is telling his story to *Dido*, happening to mention the death of his father, makes a sudden address to him as follows:

—hic, pelagi tot tempestatibus actus,  
Heu, genitorem, omnis curæ casusque levamen,  
Amitto Anchisen:—hic me, pater optime, fessum  
Deferis, heu, tantis nequicquam crepte periculis!

This apostrophe has a pleasing effect. It seems to intimate, that the love which the hero bore his father was so great, that when he mentioned him, he forgot every thing else; and, without minding his company, one of whom was a queen, suddenly addressed himself to that which, though present only in idea, was still a principal object of his affection. An emotion so warm and so reasonable cannot fail to command the sympathy of the reader.—When *Michael*, in the eleventh book of *Paradise Lost*, announces

Vol. VIII.

to Adam and Eve the necessity of their immediate departure from the garden of Eden, the poet's art in preferring the decorum of the two characters is very remarkable. Pierced to the heart at the thought of leaving that happy place, Eve, in all the violence of ungovernable sorrow, breaks forth into a pathetic apostrophe to *Paradise*, to the flowers she had reared, and to the nuptial bower she had adorned. Adam makes no address to the walks, the trees, or the flowers of the garden, the loss whereof did not so much afflict him; but, in his reply to the Archangel, expresses, without a figure, his regret for being banished from a place where he had been so oft honoured with a sensible manifestation of the Divine presence. The use of the apostrophe in the one case, and the omission of it in the other, not only gives a beautiful variety to the style, but also marks that superior elevation and composure of mind, by which the poet had all along distinguished the character of Adam.—One of the finest applications of this figure that is any where to be seen, is in the fourth book of the same poem; where the author, catching by sympathy the devotion of our first parents, suddenly drops his narrative, and joins his voice to theirs in adoring the Father of the universe.

Thus at their shady lodge arriv'd, both flood,  
Both turn'd, and under open sky ador'd  
The God that made both sky, air, earth, and heav'n,  
Which they beheld, the moon's resplendent globe,  
And starry pole:—Thou also mad'st the night,  
Maker Omnipotent! and thou the day,  
Which we in our appointed work employ'd  
Have finish'd.

Milton took the hint of this fine contrivance from a well-known passage of Virgil:

Hic juvenum chorus, ille senum; qui carmine laudes  
Herculeas et facta ferant;—  
—ut duros mille labores  
Rege sub Eurytheo, fatis Junonis iniquæ  
Pertulerit:—Tu nubigenas, invictæ, bimbres  
Hylæum Pholomque manu; tu Creta maclas  
Prodigia.

The beauty arising from diversified composition is the same in both, and very great in each. But every reader must feel, that the figure is incomparably more affecting to the mind in the imitation, than in the original. So true it is, that the most rational emotions raise the most intense fellow-feeling; and that the apostrophe is then the most emphatical, when it displays those workings of human affection which are at once ardent and well-founded.

To conclude this head: Tropes and figures, particularly the *metaphor*, *similitude*, and *allegory*, are further useful in beautifying language, by suggesting, together with the thoughts essential to the subject, an endless variety of agreeable images, for which there would be no place, if writers were always to confine themselves to the proper names of things. And this beauty and variety, judiciously applied, is so far from distracting, that it tends rather to fix, the attention, and captivate the heart of the readers, by giving light, and life, and pathos to the whole composition.

II. That tropes and figures are more necessary to poetry, than to any other mode of writing, was the second point propoed to be illustrated in this section.

Of Tropes  
and Figures.

Of Poetical  
Harmony.

Language, as already observed, is then natural, when it is suitable to the supposed condition of the speaker. Figurative language is peculiarly suitable to the supposed condition of the poet; because figures are suggested by the fancy; and the fancy of him who composes poetry is more employed, than that of any other author. Of all historical, philosophical, and theological researches, the object is *real* truth, which is fixed and permanent. The aim of rhetorical declamation (according to Cicero) is *apparent* truth; which, being less determinate, leaves the fancy of the speaker more free, gives greater scope to the inventive powers, and supplies the materials of a more figurative phraseology. But the poet is subject to no restraints, but those of verisimilitude; which is still less determinate than rhetorical truth. He seeks not to convince the judgment of his reader by arguments of either real or apparent cogency; he means only to please and interest him, by an appeal to his sensibility and imagination. His own imagination is therefore continually at work, ranging through the whole of real and probable existence, "glancing from heaven to earth, from earth to heaven," in quest of images and ideas suited to the emotions he himself feels, and to the sympathies he would communicate to others. And, consequently, figures of speech, the offspring of ex-cursive fancy, must (if he speak according to what he is supposed to think and feel, that is, according to his supposed condition) tincture the language of the poet more than that of any other composer. So that, if figurative diction be unnatural in geometry, because all wanderings of fancy are unsuitable, and even impossible, to the geometrician, while intent upon his argument; it is, upon the same principle, perfectly natural, and even unavoidable, in poetry; because the more a poet attends to his subject, and the better qualified he is to do it justice, the more active will his imagination be, and the more diversified the ideas that present themselves to his mind.—Besides, the true poet addresses himself to the passions and sympathies of mankind; which, till his own be raised, he cannot hope to do with success. And it is the nature of many passions, though not of all, to increase the activity of imagination: and an active imagination naturally vents itself in figurative language; nay, unless restrained by a correct taste, has a tendency to exceed in it;—of which bishop Taylor, and lord Verulam, two geniuses different in kind, but of the highest order, are memorable examples.

We said, that "the poet seeks not to convince the judgment of his reader by arguments of either real or apparent cogency."—We do not mean, that in poetry argument has no place. The most legitimate reasoning, the soundest philosophy, and narratives purely historical, may appear in a poem, and contribute greatly to the honour of the author, and to the importance of his work. All this we have in *Paradise Lost*.—We mean, that what distinguishes *pure* poetry from other writing, is its aptitude, not to sway the judgment by reasoning, but to please the fancy, and move the passions, by a lively imitation of nature. Nor would we exclude poetical embellishment from history, or even from philosophy. Plato's *Dialogues* and Addison's *Moral Essays* abound in poetic imagery; and Livy and Tacitus often amuse their readers with poetical description. In like manner, though geome-

try and physics be different sciences;—though abstract ideas be the subject, and pure demonstration or intuition the evidence, of the former; and though the material universe, and the informations of sense, be the subject and the evidence of the latter;—yet have these sciences been united by the best philosophers, and very happy effects resulted from the union.—In one and the same work, poetry, history, philosophy, and oratory, may doubtless be blended; nay, these arts have all been actually blended in one and the same work, not by Milton only, but also by Homer, Virgil, Lucan, and Shakespeare. Yet still these arts are different;—different in their ends and principles, and in the faculties of the mind to which they are respectively addressed: and it is easy to perceive, when a writer employs one, and when another.

## § 2. Of the Sound of Poetical Language.

20. As the ear, like every other perceptive faculty, is capable of gratification, regard is to be had to the sound of words, even in prose. But to the harmony of language, it behoves the poet, more than any other writer, to attend; as it is more especially his concern to render his work pleasurable. In fact, we find, that no poet was ever popular who did not possess the art of harmonious composition.

What belongs to the subject of Poetical Harmony may be referred to one or other of these heads: Sweetness, Measure, and Imitation.

I. In order to give *sweetness* to language, either in verse or prose, all words of harsh sound, difficult pronunciation, or unwieldy magnitude, are to be avoided as much as possible, unless when they have in the sound something peculiarly emphatic; and words are to be so placed in respect of one another, as that discordant combinations may not result from their union. But in poetry this is more necessary than in prose; poetical language being understood to be an imitation of natural language improved to that perfection which is consistent with probability. To poetry, therefore, a greater latitude must be allowed than to prose, in expressing, by tropes and figures of pleasing sound, those ideas whereof the proper names are in any respect offensive, either to the ear or to the fancy.

II. How far *versification*, or *regular measure*, may be essential to this art, has been disputed by critical writers; some holding it to be indispensably necessary, and some not necessary at all.

The fact seems to be, as already hinted, that to poetry verse is not essential. In a prose work, we may have the fable, the arrangement, and a great deal of the pathos and language, of poetry; and such a work is certainly a poem, though perhaps not a perfect one. For how absurd would it be to say, that by changing the position only of a word or two in each line, one might divest Homer's *Iliad* of the poetical character! At this rate, the arts of poetry and versification would be the same; and the rules in Despauter's *Grammar*, and the moral distichs ascribed to Cato, would be as real poetry as any part of Virgil. In fact, some very ancient poems, when translated into a modern tongue, are far less poetical in verse than in prose; the alterations necessary to adapt them to our numbers being detrimental to their sublime simplicity; of which any person of taste will be sensible, who compares our common prose-version of Job, the

Of Poetical the Psalms, and the Song of Solomon; with the best metrical paraphrase of those books that has yet appeared.

Of Poetical Harmony.

Nay, in many cases, Comedy will be more poetical, because more pleasing and natural, in prose, than in verse. By versifying Tom Jones and The Merry Wives of Windsor, we should spoil the two finest Comic poems, the one Epic, the other Dramatic, now in the world.

But, secondly, Though verse be not essential to poetry, it is necessary to the perfection of all poetry that admits of it. Verse is to poetry, what colours are to painting (κ). A painter might display great genius, and draw masterly figures with chalk or ink; but if he intend a perfect picture, he must employ in his work as many colours as are seen in the object he imitates. Or, to adopt a beautiful comparison of Demosthenes, quoted by Aristotle †, "Versification is to poetry what bloom is to the human countenance."

† Rhetor.  
lib. 3. cap. 4.

A good face is agreeable when the bloom is gone, and good poetry may please without versification; harmonious numbers may set off an indifferent poem, and a fine bloom indifferent features: but, without verse, poetry is complete; and beauty is not perfect, unless to sweetness and regularity of feature there be super-added

The bloom of young desire, and purple light of love.

If numbers are necessary to the perfection of the higher poetry, they are no less so to that of the lower kinds, to Pastoral, Song, and Satire, which have little besides the language and versification to distinguish them from prose; and which some ancient authors are unwilling to admit to the rank of poems:—though it seems too nice a scruple, both because such writings are commonly termed *poetical*; and also because there is, even in them, something that may not improperly be considered as an imitation of nature.

That the rhythm and measures of verse are naturally agreeable, and therefore that by these poetry may be made more pleasing than it would be without them, is evident from this, that children and illiterate people, whose admiration we cannot suppose to be the effect of habit or prejudice, are exceedingly delighted with them. In many proverbial sayings, where there is neither rhyme nor alliteration, rhythm is obviously studied. Nay, the use of rhythm in poetry is universal; whereas alliteration and rhyme, though relished by some nations, are not much sought after by others. And we need not be at a loss to account for the agreeableness of proportion and order, if we reflect, that they suggest the agreeable ideas of contrivance and skill, at the same time that they render the connection of things obvious to the understanding, and imprint it deeply on the memory. Verse, by promoting distinct and easy remembrance, conveys ideas to the mind with energy, and enlivens every emotion the poet intends to raise in the reader or hearer. Besides, when we attend to verses, after hearing one or two, we become acquainted with the measure, which therefore we always look for in the sequel. This perpetual interchange of hope and gratification is a

source of delight; and to this in part is owing the pleasure we take in the rhymes of modern poetry. And hence we see, that though an incorrect rhyme, or untuneable verse, be in itself, and compared with an important sentiment, a very trifling matter; yet it is no trifle in regard to its effects on the hearer; because it brings disappointment, and so gives a temporary shock to the mind, and interrupts the current of the affections; and because it suggests the disagreeable ideas of negligence or want of skill on the part of the author. And therefore, as the public ear becomes more delicate, the negligence will be more glaring, and the disappointment more intensely felt; and correctness of rhyme and of measure will of course be the more indispensable. In our tongue, rhyme is more necessary to Lyric than to Heroic poetry. The reason seems to be, that in the latter the ear can of itself perceive the boundary of the measure, because the lines are all of equal length nearly, and every good reader makes a short pause at the end of each; whereas, in the former, the lines vary in length: and therefore the rhyme is requisite to make the measure and rhythm sufficiently perceptible. Custom too may have some influence. English Odes without rhyme are uncommon; and therefore have something awkward about them, or something at least to which the public ear is not yet thoroughly reconciled.

Moreover, in poetry, as in music, rhythm is the source of much pleasing variety; of variety tempered with uniformity, and regulated by art: inasmuch, that, notwithstanding the likeness of one hexameter verse to another, it is not common, either in Virgil or in Homer, to meet with two contiguous hexameters whose rhythm is exactly the same. And though all English heroic verses consist of five feet, among which the iambic predominates; yet this measure, in respect of rhythm alone, is susceptible of more than 30 varieties. And let it be remarked further, that different kinds of verse, by being adapted to different subjects and modes of writing, give variety to the poetic language, and multiply the charms of this pleasing art.

What has formerly been shown to be true in regard to style, will also in many cases hold true of versification, "that it is then *natural*, when it is adapted to the *supposed condition* of the speaker."—In the epopee, the poet assumes the character of calm inspiration; and therefore his language must be elevated, and his numbers majestic and uniform. A peasant speaking in heroic or hexameter verse is no improbability here; because his words are supposed to be transmitted by one who will of his own accord give them every ornament necessary to reduce them into dignified measure; as an eloquent man, in a solemn assembly, recapitulating the speech of a clown, would naturally express it in pure and perspicuous language. The uniform heroic measure will suit any subject of dignity, whether narrative or didactic, that admits or requires uniformity of style. In tragedy, where the imitation of real life is more perfect than in epic poetry, the uniform magnificence of epic numbers might be improper; because the heroes and heroines are supposed to speak in their

35 I 2

OWA

(κ) Horace seems to hint at the same comparison, when, after specifying the several sorts of verse suitable to Epic, Elegiac, Lyric, and Dramatic Poetry, he adds,

*Descriptas servare vices, operumque colores.*

*Cur ego, si neque ignoroque, Poeta salutor?* *Æt. Poet. vers. 86.*

Of Poetical Harmony.] own persons, and according to the immediate impulse of passion and sentiment. Yet, even in tragedy, the verification may be both harmonious and dignified; because the characters are taken chiefly from high life, and the events from a remote period; and because the higher poetry is permitted to imitate nature, not as it is, but in that state of perfection in which it might be. The Greeks and Romans considered their hexameter as too artificial for dramatic poetry; and therefore in tragedy, and even in comedy, made use of the iambic, and some other measures that came near the cadence of conversation: we use the iambic both in the epic and dramatic poem; but for the most part it is, or ought to be, much more elaborate in the former than in the latter. In dramatic comedy, where the manners and concerns of familiar life are exhibited, verse would seem to be unnatural, except it be so like the sound of common discourse, as to be hardly distinguishable from it. Custom, however, may in some countries determine otherwise; and against custom, in these matters, it is vain to argue. The professed enthusiasm of the dithyrambic poet renders wildness, variety, and a sonorous harmony of numbers, peculiarly suitable to his odes. The love-sonnet, and Anacreontic song, will be less various, more regular, and of a softer harmony; because the state of mind expressed in it has more composure. Philosophy can scarce go further in this investigation, without deviating into whim and hypothesis. The particular sorts of verse to be adopted in the lower species of poetry, are determined by fashion chiefly, and the practice of approved authors.

III. The origin and principles of *imitative harmony*, or of that artifice by which the sound is made, as Pope says, "an echo to the sense," may be explained in the following manner.

It is pleasing to observe the uniformity of nature in all her operations. Between moral and material beauty and harmony, between moral and material deformity and dissonance, there obtains a very striking analogy. The visible and audible expressions of almost every virtuous emotion are agreeable to the eye and the ear, and those of almost every criminal passion disagreeable. The looks, the attitudes, and the vocal sounds, natural to benevolence, to gratitude, to compassion, to piety, are in themselves graceful and pleasing; while anger, discontent, despair, and cruelty, bring discord to the voice, deformity to the features, and distortion to the limbs. That flowing curve, which painters know to be essential to the beauty of animal shape, gives place to a multiplicity of right lines and sharp angles in the countenance and gesture of him who knits his brows, stretches his nostrils, grinds his teeth, and clenches his fist; whereas devotion, magnanimity, benevolence, contentment, and good-humour, soften the attitude, and give a more graceful swell to the outline of every feature. Certain vocal tones accompany certain mental emotions. The voice of sorrow is feeble and broken, that of despair boisterous and incoherent; joy assumes a sweet and sprightly note, fear a weak and tremulous cadence; the tones of love and benevolence are musical and uniform, those of rage loud and dissonant; the voice of the sedate reasoner is equable and grave, but not unpleasant; and he who declaims with energy, employs many varieties of modulation suited to the various emo-

tions that predominate in his discourse.

But it is not in the language of passion only, that the human voice varies its tone, or the human face its features. Every striking sentiment, and every interesting idea, has an effect upon it. One would esteem that person no adept in narrative eloquence, who should describe with the very same accent, swift and slow motion, extreme labour and easy performance, agreeable sensation and excruciating pain; who should talk of the tumult of a tempestuous ocean, the roar of thunder, the devastations of an earthquake, or an Egyptian pyramid tumbling into ruins, in the same tone of voice wherewith he describes the murmur of a rill, the warbling of the harp of Eolus, the swinging of a cradle, or the descent of an angel. Elevation of mind gives dignity to the voice. From Achilles, Sarpedon, and Othello, we should as naturally expect a manly and sonorous accent, as a nervous style and majestic attitude. Coxcombs and bullies, while they assume airs of importance and valour, affect also a dignified articulation.

Since the tones of natural language are so various, poetry, which imitates the language of nature, must also vary its tones; and, in respect of sound as well as of meaning, be framed after that model of ideal perfection, which the variety and energy of the human articulate voice render probable. This is the more easily accomplished, because, in every language, there is between the found and sense of certain words a perceptible analogy; which, though not so accurate as to lead a foreigner from the found to the signification, is yet accurate enough to show, that, in forming such words, regard has been had to the imitative qualities of vocal found. Such, in English, are the words yell, crash, crack, hiss, roar, murmur, and many others.

All the particular laws that regulate this sort of imitation, as far as they are founded in nature, and liable to the cognizance of philosophy, depend on the general law of style above-mentioned. Together with the other circumstances of the supposed speaker, the poet takes into consideration the tone of voice suitable to the ideas that occupy his mind, and thereto adapts the found of his language, if it can be done consistently with ease and elegance of expression. But when this imitative harmony is too much sought after, or words appear to be chosen for found rather than sense, the verse becomes finical and ridiculous. Such is *Ronsard's* affected imitation of the song of the sky-lark:

Elle quindée du zephire  
Sublime en l'air vire et revire,  
Et y declique un joli cris,  
Qui rit, guérit, et tire l'ire  
Des esprit mieux que je n'écris.

This is as ridiculous as that line of *Ennius*,

Tum tuba terribili sonitu tarantantara dixit:

Or as the following verses of *Swift*;

The man with the kettle-drum enters the gate,  
Dnb dub a dub dub: the trumpeters follow,  
Tantara tantara; while all the boys hollow.

Words by their found may imitate found; and quick or slow articulation may imitate quick or slow motion. Hence, by a proper choice and arrangement of words, the

of Poetical  
Harmony.

nity (F),—sweet and tender (G),—loud (H),—and harsh (I);—and *Motions* that are, flow in consequence of dignity (K),—flow in consequence of difficulty (L), swift and noisy (M),—swift and smooth (N),—uneven and abrupt (O),—quick and joyous (P). An unexpected pause in the verse may also imitate a sudden failure of strength (Q), or interruption of motion (R), or give vivacity to an image or thought, by fixing our

attention longer than usual upon the word that pre-Of Poetical  
cedes it (S).—Moreover, when we describe great bulk, Harmony.  
it is natural for us to articulate slowly even in common discourse; and therefore a line of poetry that requires a slow pronunciation, or seems longer than it should be, may be used with good effect in describing vastness of size (T).—Sweet and smooth numbers are most proper, when the poet paints agreeable objects, or gentle energy (U); and harsher sounds when he speaks of

(F) No sooner had th' Almighty ceas'd, than all  
The multitude of angels, with a shout  
Loud as from numbers without number, sweet  
As from blest voices uttering joy; heav'n rung  
With jubilee, and loud halleluans fill'd  
The eternal regions.— *Par. Lost*, b. 3.

Drama.

of what is ugly, violent, or disagreeable (x). This too is according to the nature of common language; for we generally employ harsher tones of voice to express what we dislike, and more melodious notes to describe the objects of love, complacency, or admiration. Harsh numbers, however, should not be frequent in poetry. For in this art, as in music, concord and melody ought always to predominate. And we find in fact, that good poets can occasionally express themselves somewhat harshly, when the subject requires it, and yet preserve the sweetness and majesty of poetical diction.—Further, the voice of complaint, pity, love, and all the gentler affections, is mild and musical, and should therefore be imitated in musical numbers; while despair, defiance, revenge, and turbulent emotions in general, assume an abrupt and sonorous cadence. Dignity of description (y), solemn vows (z), and all sentiments that proceed from a mind elevated with great ideas (A), require a correspondent pomp of language and verification.—Lastly, an irregular or uncommon movement in the verse, may some-

times be of use, to make the reader conceive an image in a particular manner. Virgil, describing horses running over rocky heights at full speed, begins the line with two dactyls, to imitate rapidity, and concludes it with eight long syllables:

Saxa per, et scopulos, et depressas convalles.

Geor. III. 276.

which is a very unusual measure, but seems well adapted to the thing expressed, namely, to the descent of the animal from the hills to the low ground. At any rate, this extraordinary change of the rhythm may be allowed to bear some resemblance to the animal's change of motion, as it would be felt by a rider, and as we may suppose it is felt by the animal itself.

Other forms of imitative harmony, and many other examples, besides those referred to in the margin, will readily occur to all who are conversant in the writings of the best versifiers, particularly Homer, Virgil, Milton, Lucretius, Spenser, Dryden, Shakespeare, Pope, and Gray.

## PART II. OF THE DIFFERENT SPECIES OF POETRY, with their PARTICULAR PRINCIPLES.

### SECT. I. Of Epic and Dramatic Compositions.

#### § 1. The *Epoëe* and *Drama* compared.

Elem. of  
Criticism.

21. **T**RAGEDY and the epic differ not in substantial: in both the same ends are proposed, viz. instruction and amusement; and in both the same mean is employed, viz. imitation of human actions. They differ only in the manner of imitating: epic poetry employs narration; tragedy represents its facts as passing in our sight: in the former, the poet introduces himself as an historian; in the latter, he presents his actors, and never himself.

This difference, regarding form only, may be thought slight: but the effects it occasions, are by no means so; for what we see makes a deeper impression than what we learn from others. A narrative poem is a story told by another: facts and incidents passing upon the stage, come under our own observation; and are beside much enlivened by action and gesture, expressive of many sentiments beyond the reach of language.

A dramatic composition has another property, independent altogether of action; which is, that it makes a deeper impression than narration: in the former, persons express their own sentiments; in the latter, sentiments are related at second-hand. For that reason, Aristotle, the father of critics, lays it down as a rule\*, That in an epic poem the author ought to take every opportunity of introducing his actors, and of confining

the narrative part within the narrowest bounds. Homer understood perfectly the advantage of this method; and his poems are both of them in a great measure dramatic. Lucan runs to the opposite extreme: and is guilty of a still greater fault, in stuffing his *Pharfalla* with cold and languid reflections, the merit of which he assumes to himself, and deigns not to share with his actors. Nothing can be more injudiciously timed, than a chain of such reflections, which suspend the battle of *Pharfalla* after the leaders had made their speeches, and the two armies are ready to engage†.

Aristotle, from the nature of the fable, divides tragedy into simple and complex: but it is of greater moment, with respect to dramatic as well as epic poetry, to found a distinction upon the different ends attained by such compositions. A poem, whether dramatic or epic, that has nothing in view but to move the passions and to exhibit pictures of virtue and vice, may be distinguished by the name of *pathetic*: but where a story is purposely contrived to illustrate some moral truth, by showing that disorderly passions naturally lead to external misfortunes, such composition may be denominated *moral*. Beside making a deeper impression than can be done by cool reasoning, a moral poem does not fall short of reasoning in affording conviction: the natural connection of vice with misery, and of virtue with happiness, may be illustrated by stating a fact as well as by urging an argument. Let us assume, for example, the following moral truths: That discord among

Of the  
epopee and  
Drama.

among the chiefs renders ineffectual all common measures; and that the consequences of a slightly-founded quarrel, fostered by pride and arrogance, are not less fatal than those of the grossest injury: these truths may be inculcated, by the quarrel between Agamemnon and Achilles at the siege of Troy. If facts or circumstances be wanting, such as tend to rouse the turbulent passions, they must be invented; but no accidental nor unaccountable event ought to be admitted; for the necessary or probable connection between vice and misery is not learned from any events but what are naturally occasioned by the characters and passions of the persons represented, acting in such circumstances. A real event of which we see not the cause, may afford a lesson, upon the presumption that what hath happened may again happen: but this cannot be inferred from a story that is known to be a fiction.

Many are the good effects of such compositions. A pathetic composition, whether epic or dramatic, tends to a habit of virtue, by exciting us to do what is right, and restraining us from what is wrong. Its frequent pictures of human woes, produce, beside, two effects extremely salutary: they improve our sympathy, and fortify us to bear our own misfortunes. A moral composition must obviously produce the same good effects, because by being moral it ceaseth not to be pathetic: it enjoys beside an excellence peculiar to itself; for it not only improves the heart, as above-mentioned, but instructs the head by the moral it contains. It seems impossible to imagine any entertainment more suited to a rational being, than a work thus happily illustrating some moral truth; where a number of persons of different characters are engaged in an important action, some retarding, others promoting, the great catastrophe; and where there is dignity of style as well as of matter. A work of this kind has our sympathy at command, and can put in motion the whole train of the social affections: our curiosity in some scenes is excited, in others gratified; and our delight is consummated at the close, upon finding, from the characters and situations exhibited at the commencement, that every incident down to the final catastrophe is natural, and that the whole in conjunction make a regular chain of causes and effects.

Considering that an epic and a dramatic poem are the same in substance, and have the same aim or end, one will readily imagine, that subjects proper for the one must be equally proper for the other. But considering their difference as to form, there will be found reason to correct that conjecture, at least in some degree. Many subjects may indeed be treated with equal advantage in either form: but the subjects are still more numerous for which they are not equally qualified; and there are subjects proper for the one, and not at all for the other. To give some slight notion of the difference, as there is no room here for enlarging upon every article, we observe, that dialogue is better qualified for expressing sentiments, and narrative for displaying facts. Heroism, magnanimity, undaunted courage, and other elevated virtues, figure best in action: tender passions, and the whole tribe of sympathetic affections, figure best in sentiment. It clearly follows, that tender passions are more peculiarly the province of tragedy, grand and heroic actions of epic poetry.

Of the  
Epopee and  
Drama.

22. We have no occasion to say more upon the epic, considered as peculiarly adapted to certain subjects. But as dramatic subjects are more complex, it is necessary to take a narrower view of them; which we do the more willingly, in order to clear a point thrown into great obscurity by critics.

The subject best fitted for tragedy is where a man has himself been the cause of his misfortune; not so as to be deeply guilty, nor altogether innocent: the misfortune must be occasioned by a fault incident to human nature, and therefore in some degree venial. Such misfortunes call forth the social affections, and warmly interest the spectator. An accidental misfortune, if not extremely singular, doth not greatly move our pity: the person who suffers, being innocent, is freed from the greatness of all torments, that anguish of mind which is occasioned by remorse. An atrocious criminal, on the other hand, who brings misfortunes upon himself, excites little pity, for a different reason: his remorse, it is true, aggravates his distress, and swells the first emotions of pity; but then our hatred of him as a criminal blending with pity, blunts its edge considerably. Misfortunes that are not innocent, nor highly criminal, partake the advantages of each extreme: they are attended with remorse to embitter the distress, which raises our pity to a great height; and the slight indignation we have at a venial fault, detracts not sensibly from our pity. The happiest of all subjects accordingly for raising pity, is where a man of integrity falls into a great misfortune by doing an action that is innocent, but which, by some singular means, is conceived by him to be criminal: his remorse aggravates his distress; and our compassion, unrestrained by indignation, knows no bounds. Pity comes thus to be the ruling passion of a pathetic tragedy; and, by proper representation, may be raised to a height scarce exceeded by any thing felt in real life. A moral tragedy takes in a larger field; as it not only exercises our pity, but raises another passion, which, though selfish, deserves to be cherished equally with the social affection. The passion we have in view is fear or terror; for when a misfortune is the natural consequence of some wrong bias in the temper, every spectator who is conscious of such a bias in himself, takes the alarm, and dreads his falling into the same misfortune: and by the emotion of fear or terror, frequently reiterated in a variety of moral tragedies, the spectators are put upon their guard against the disorders of passion.

The commentators upon Aristotle, and other critics, have been much gravelled about the account given of tragedy by that author: "That by means of pity and terror, it refines or purifies in us all sorts of passion." But no one who has a clear conception of the end and effects of a good tragedy, can have any difficulty about Aristotle's meaning: Our pity is engaged for the persons represented; and our terror is upon our own account. Pity indeed is here made to stand for all the sympathetic emotions, because of these it is the capital. There can be no doubt, that our sympathetic emotions are refined or improved by daily exercise; and in what manner our other passions are refined by terror, has been just now said. One thing is certain, that no other meaning can justly be given to the foregoing doctrine than that now mentioned; and that it was really Aristotle's

Of the  
Epopée and  
Drama.

Aristotle's meaning, appears from his 13th chapter, where he delivers several propositions conformable to the doctrine as here explained. These, at the same time, we take liberty to mention; because, so far as authority can go, they confirm the foregoing reasoning about subjects proper for tragedy. The first proposition is, That it being the province of tragedy to excite pity and terror, an innocent person falling into adversity ought never to be the subject. This proposition is a necessary consequence of his doctrine as explained: a subject of that nature may indeed excite pity and terror; but the former in an inferior degree, and the latter in no degree for moral instruction. The second proposition is, That the history of a wicked person in a change from misery to happiness, ought not to be represented; which excites neither terror nor compassion, nor is agreeable in any respect. The third is, That the misfortunes of a wicked person ought not to be represented: such representation may be agreeable in some measure upon a principle of justice; but it will not move our pity; nor any degree of terror, except in those of the same vicious disposition with the person represented. The last proposition is, That the only character fit for representation lies in the middle, neither eminently good nor eminently bad; where the misfortune is not the effect of deliberate vice, but of some involuntary fault, as our author expresses it. The only objection we find to Aristotle's account of tragedy, is, that he confines it within too narrow bounds, by refusing admittance to the pathetic kind: for if terror be essential to tragedy, no representation deserves that name but the moral kind, where the misfortunes exhibited are caused by a wrong balance of mind, or some disorder in the internal constitution: such misfortunes always suggest moral instruction; and by such misfortunes only, can terror be excited for our improvement.

Thus Aristotle's four propositions above-mentioned, relates solely to tragedies of the moral kind. Those of the pathetic kind, are not confined within so narrow limits: subjects fitted for the theatre, are not in such plenty as to make us reject innocent misfortunes which rouse our sympathy, though they inculcate no moral. With respect indeed to the subjects of that kind, it may be doubted, whether the conclusion ought not always to be fortunate. Where a person of integrity is represented as suffering to the end under misfortunes purely accidental, we depart discontented, and with some obscure sense of injustice: for seldom is man so submissive to Providence, as not to revolt against the tyranny and vexations of blind chance; he will be tempted to say, This ought not to be. We give for an example the *Romeo and Juliet* of Shakespeare, where the fatal catastrophe is occasioned by Friar Laurence's coming to the monument a minute too late: we are vexed at the unlucky chance, and go away dissatisfied. Such impressions, which ought not to be cherished, are a sufficient reason for excluding stories of this kind from the theatre. The misfortunes of a virtuous person, arising from necessary causes, or from a chain of unavoidable circumstances, will be considered in a different light. Chance, giving an impression of anarchy and misuse, produces always a gloomy prospect: on the contrary, a regular chain of causes and effects directed by the general laws of nature, never fails to

Of the  
Epopée and  
Drama.

suggest the hand of Providence; to which we submit without resentment, being conscious that submission is our duty. For that reason, we are not disgusted with the distresses of Voltaire's *Mariamne*, though redoubled on her till her death, without the least fault or failing on her part: her misfortunes are owing to a cause extremely natural, and not unfrequent, the jealousy of a barbarous husband. The fate of Desdemona in the *Moor of Venice*, affects us in the same manner. We are not so easily reconciled to the fate of Cordelia in *King Lear*: the causes of her misfortune are by no means so evident, as to exclude the gloomy notion of chance. In short, a perfect character suffering under misfortunes, is qualified for being the subject of a pathetic tragedy, provided chance be excluded. Nor is a perfect character altogether inconsistent with a moral tragedy: it may successfully be introduced as an under-part, if the chief place be filled with an imperfect character from which a moral can be drawn. This is the case of Desdemona and Mariamne just mentioned; and it is the case of Monimia and Belvidera, in Otway's two tragedies, *The Orphan* and *Venice preserved*.

According to our author \*, false operations on our *La Kamee*, passions, by representing its events as passing in our *Elen. of* sight, and by deluding us into a conviction of reality. *Crit. ch. ii.* Hence, in epic and dramatic compositions, every circumstance ought to be employed that may promote the delusion; such as the borrowing from history some noted event, with the addition of circumstances that may answer the author's purpose: the principal facts are known to be true; and we are disposed to extend our belief to every circumstance. But in choosing a subject that makes a figure in history, greater precaution is necessary than where the whole is a fiction. In the latter case there is full scope for invention: the author is under no restraint other than that the characters and incidents be just copies of nature. But where the story is founded on truth, no circumstances must be added, but such as connect naturally with what are known to be true; history may be supplied, but must not be contradicted. Further, the subject chosen must be distant in time, or at least in place; for the familiarity of recent persons and events ought to be avoided. Familiarity ought more especially to be avoided in an epic poem, the peculiar character of which is dignity and elevation: modern manners make but a poor figure in such a poem. Their familiarity unqualifies them for a lofty subject. The dignity of them will be better understood in future ages, when they are no longer familiar.

After Voltaire, no writer, it is probable, will think of rearing an epic poem upon a recent event in the history of his own country. But an event of that kind is perhaps not altogether unqualified for tragedy: it was admitted in Greece; and Shakespeare has employed it successfully in several of his pieces. One advantage it possesses above fiction, that of more readily engaging our belief, which tends above any other particular to raise our sympathy. The scene of comedy is generally laid at home: familiarity is no objection; and we are peculiarly sensible of the ridicule of our own manners.

After a proper subject is chosen, the dividing it into parts requires some art. The conclusion of a book in

Of the  
Epoëe and  
Drama.

Of the  
Epoëe.

Elem. of  
Criticism,  
ch. 22.

in an epic poem, or of an act in a play, cannot be altogether arbitrary; nor be intended for so slight a purpose as to make the parts of equal length. The supposed pause at the end of every book, and the real pause at the end of every act, ought always to coincide with some pause in the action. In this respect, a dramatic or epic poem ought to resemble a sentence or period in language, divided into members that are distinguished from each other by proper pauses; or it ought to resemble a piece of music, having a full close at the end, preceded by imperfect closes that contribute to the melody. Every act in a dramatic poem ought therefore to close with some incident that makes a pause in the action; for otherwise there can be no pretext for interrupting the representation. It would be absurd to break off in the very heat of action; against which every one would exclaim: the absurdity still remains where the action relents, if it be not actually suspended for some time. This rule is also applicable to an epic poem: though in it a deviation from the rule is less remarkable; because it is in the reader's power to hide the absurdity, by proceeding instantly to another book. The first book of *Paradise Lost* ends without any close, perfect or imperfect: it breaks off abruptly, where Satan, seated on his throne, is prepared to harangue the convocated host of the fallen angels; and the second book begins with the speech. Milton seems to have copied the *Æneid*, of which the two first books are divided much in the same manner. Neither is there any proper pause at the end of the seventh book of *Paradise Lost*, nor at the end of the eleventh. In the *Iliad* little attention is given to this rule.

This branch of the subject shall be closed with a general rule, That action being the fundamental part of every composition, whether epic or dramatic, the sentiments and tone of language ought to be subservient to the action, so as to appear natural, and proper for the occasion. The application of this rule to our modern plays, would reduce the bulk of them to a skeleton.

#### § 2. *Respective peculiarities of the Epoëe and Drama.*

23. In a theatrical entertainment, which employs both the eye and the ear, it would be a gross absurdity to introduce upon the stage superior beings in a visible shape. There is no place for such objection in an epic poem; and Boileau, with many other critics, declares strongly for that sort of machinery in an epic poem. But waving authority, which is apt to impose upon the judgment, let us draw what light we can from reason. We may in the first place observe, that this matter is but indistinctly handled by critics: the poetical privilege of animating insensible objects for enlivening a description, is very different from what is termed *machinery*, where deities, angels, devils, or other supernatural powers, are introduced as real personages, mixing in the action, and contributing to the catastrophe; and yet these two things are constantly jumbled together in reasoning. The former is founded on a natural principle: but nothing is more unnatural than the latter. Its effects, at the same time, are deplorable. First, it gives an air of fiction to the whole; and prevents that impression of reality which is requisite to interest our affections, and to move our

passions: which of itself is sufficient to explode machinery, whatever entertainment it may afford to readers of a fantastic taste or irregular imagination. And, next, were it possible, by disguising the fiction, to delude us into a notion of reality, an insuperable objection would still remain, which is, that the aim or end of an epic poem can never be attained in any perfection where machinery is introduced; for an evident reason, that virtuous emotions cannot be raised successfully but by the actions of those who are endued with passions and affections like our own, that is, by human actions: and as for moral instruction, it is clear, that none can be drawn from beings who act not upon the same principles with us. A fable in *Æsop's* manner is no objection to this reasoning: his lions, bulls, and goats, are truly men under disguise; they act and feel in every respect as human beings; and the moral we draw is founded on that supposition. Homer, it is true, introduces the gods into his fable: but the religion of his country authorised that liberty; it being an article in the Grecian creed, that the gods often interpose visibly and bodily in human affairs. It must however be observed, that Homer's deities do no honour to his poems: fictions that transgress the bounds of nature, seldom have a good effect; they may inflame the imagination for a moment, but will not be relished by any person of a correct taste. They may be of some use to the lower rank of writers; but an author of genius has much finer materials of Nature's production, for elevating his subject, and making it interesting.

One would be apt to think, that Boileau, declaring for the Heathen deities, intended them only for embellishing the diction: but unluckily he banishes angels and devils, who undoubtedly make a figure in poetic language, equal to the Heathen deities. Boileau, therefore, by pleading for the latter in opposition to the former, certainly meant, if he had any distinct meaning, that the Heathen deities may be introduced as actors. And, in fact, he himself is guilty of that glaring absurdity, where it is not so pardonable as in an epic poem: In his ode upon the taking of Namur, he demands with a most serious countenance, whether the walls were built by Apollo or Neptune: and in relating the passage of the Rhine, anno 1672, he describes the god of that river as fighting with all his might to oppose the French monarch; which is confounding fiction with reality at a strange rate. The French writers in general run into this error: wonderful the effect of custom, entirely to hide from them how ridiculous such fictions are!

That this is a capital error in *Gierusalemme liberata*, Tasso's greatest admirers must acknowledge: a situation can never be intricate, nor the reader ever in pain about the catastrophe, so long as there is an angel, devil, or magician, to lend a helping hand. Voltaire, in his essay upon epic poetry, talking of the *Pharsalia*, observes judiciously, "That the proximity of time, the notoriety of events, the character of the age, enlightened and political, joined with the solidity of Lucan's subject, deprived him of poetical fiction." Is it not amazing, that a critic who reasons so justly with respect to others, can be so blind with respect to himself? Voltaire, not satisfied to enrich his language with images drawn from invisible and superior

rior beings, introduces them into the action: in the sixth canto of the *Henriade*, St Louis appears in person, and terrifies the soldiers; in the seventh canto, St Louis sends the god of Sleep to Henry; and, in the tenth, the demons of Discord, Fanaticism, War, &c. assist Aumale in a single combat with Turenne, and are driven away by a good angel brandishing the sword of God. To blend such fictitious personages in the same action with mortals, makes a bad figure at any rate; and is intolerable in a history so recent as that of Henry IV. But perfection is not the lot of man.

But perhaps the most successful weapon that can be employed upon this subject is ridicule. Addison has applied this in an elegant manner: "Whereas the time of a general peace is, in all appearance, drawing near; being informed that there are several ingenious persons who intend to shew their talents on so happy an occasion, and being willing, as much as in me lies, to prevent that effusion of nonsense which we have good cause to apprehend; I do hereby strictly require every person who shall write on this subject, to remember that he is a Christian, and not to sacrifice his catholicism to his poetry. In order to it, I do expect of him, in the first place, to make his own poem, without depending upon Phœbus for any part of it, or calling out for aid upon any of the Muses by name. I do likewise positively forbid the sending of Mercury with any particular message or dispatch relating to the peace; and shall by no means suffer Minerva to take upon her the shape of any plenipotentiary concerned in this great work. I do further declare, that I shall not allow the Destinies to have had a hand in the deaths of the several thousands who have been slain in the late war; being of opinion that all such deaths may be well accounted for by the Christian system of powder and ball. I do therefore strictly forbid the Fates to cut the thread of man's life upon any pretence whatsoever, unless it be for the sake of rhyme. And whereas I have good reason to fear, that Neptune will have a great deal of business on his hands in several poems which we may now suppose are upon the anvil, I do also prohibit his appearance, unless it be done in metaphor, simile, or any very short allusion; and that even here he may not be permitted to enter, but with great caution and circumspection. I desire that the same rule may be extended to his whole fraternity of Heathen gods; it being my design to condemn every poem to the flames in which Jupiter thunders, or exercises any other act of authority which does not belong to him. In short, I expect that no Pagan agent shall be introduced, or any fact related which a man cannot give credit to with a good conscience. Provided always, that nothing herein contained shall extend, or be construed to extend, to several of the female poets in this nation, who shall still be left in full possession of their gods and goddesses, in the same manner as if this paper had never been written." *Spect.* n<sup>o</sup> 523.

The marvellous is indeed so much promoted by machinery, that it is not wonderful to find it embraced by the bulk of writers, and perhaps of readers. If indulged at all, it is generally indulged to excess. Homer introduceth his deities with no greater ceremony than his mortals; and Virgil has still less modera-

tion: a pilot spent with watching cannot fall asleep and drop into the sea by natural means: one bed cannot receive the two lovers Æneas and Dido, without the immediate interposition of superior powers. The ridiculous in such fictions, must appear even thro' the thickest veil of gravity and solemnity.

Angels and devils serve equally with Heathen deities as materials for figurative language; perhaps better among Christians, because we believe in them, and not in Heathen deities. But every one is sensible, as well as Boileau, that the invisible powers in our creed make a much worse figure as actors in a modern poem, than the invisible powers in the Heathen creed did in ancient poems; the cause of which is not far to seek. The Heathen deities, in the opinion of their votaries, were beings elevated one step only above mankind, subject to the same passions, and directed by the same motives; therefore not altogether improper to mix with men in an important action. In our creed, superior beings are placed at such a mighty distance from us, and are of a nature so different, that with no propriety can we appear with them upon the same stage: man, a creature much inferior, loses all dignity in the comparison.

There can be no doubt, that an historical poem admits the embellishment of allegory, as well as of metaphor, simile, or other figure. Moral truth, in particular, is finely illustrated in the allegorical manner: it amuses the fancy to find abstract terms, by a sort of magic, metamorphosed into active beings; and it is delightful to trace a general proposition in a pictured event. But allegorical beings should be confined within their own sphere, and never be admitted to mix in the principal action, nor to co-operate in retarding or advancing the catastrophe; which would have a still worse effect than invisible powers. For the impression of real existence, essential to an epic poem, is inconsistent with that figurative existence which is essential to an allegory; and therefore no method can more effectually prevent the impression of reality, than the introduction of allegorical beings co-operating with those whom we conceive to be really existing. The love-episode in the *Henriade* (canto 9.) insufferable by the discordant mixture of allegory with real life, is copied from that of Rinaldo and Armida, in the *Gierusalemme liberata*, which hath no merit to entitle it to be copied. An allegorical object, such as Fame in the *Æneid*, and the temple of Love in the *Henriade*, may find place in a description: but to introduce Discord as a real personage, imploring the assistance of Love as another real personage, to enervate the courage of the hero, is making these figurative beings act beyond their sphere, and creating a strange jumble of truth and fiction. The allegory of Sin and Death in the *Paradise Lost*, is possibly not generally relished, though it is not entirely of the same nature with what we have been condemning: in a work comprehending the achievements of superior beings, there is more room for fancy than where it is confined to human actions.

What is the true notion of an episode? or how is it to be distinguished from the principal action? Every incident that promotes or retards the catastrophe, must be part of the principal action. This clears the nature of an episode; which may be defined, "An incident

connected with the principal action, but contributing neither to advance nor retard it." The descent of Æneas into hell doth not advance nor retard the catastrophe, and therefore is an episode. The story of Nisus and Euryalus, producing an alteration in the affairs of the contending parties, is a part of the principal action. The family-scene in the sixth book of the *Iliad* is of the same nature; for by Hector's retiring from the field of battle to visit his wife, the Grecians had opportunity to breathe, and even to turn upon the Trojans. The unavoidable effect of an episode according to this definition must be, to break the unity of action; and therefore it ought never to be indulged unless to unbend the mind after the fatigue of a long narration. An episode, when such is its purpose, requires the following conditions: it ought to be well connected with the principal action; it ought to be lively and interesting; it ought to be short; and a time ought to be chosen when the principal action relents (κ).

In the following beautiful episode, which closes the second book of *Fingal*, all these conditions are united.

"Comal was a son of Albion; the chief of an hundred hills. His deer drunk of a thousand streams; and a thousand rocks replied to the voice of his dogs. His face was the mildness of youth; but his hand the death of heroes. One was his love, and fair was she! the daughter of mighty Conloch. She appeared like a sun-beam among women, and her hair was like the wing of the raven. Her soul was fixed on Comal, and she was his companion in the chase. Often met their eyes of love, and happy were their words in secret. But Gormal loved the maid, the chief of gloomy Arden. He watched her lone steps on the heath, the foe of unhappy Comal.

"One day tired of the chase, when the mist had concealed their friends, Comal and the daughter of Conloch met in the cave of Ronan. It was the wonted haunt of Comal. Its sides were hung with his arms; a hundred shields of thongs were there, a hundred helms of sounding steel. Rest here, said he, my love Galvina, thou light of the cave of Ronan: a deer appears on Maro's brow; I go, but soon will return. I fear, said she, dark Gormal my foe: I will rest here; but soon return, my love.

"He went to the deer of Mora. The daughter of Conloch, to try his love, clothed her white side with his armour, and strode from the cave of Ronan. Thinking her his foe, his heart beat high, and his colour changed. He drew the bow: the arrow flew: Galvina fell in blood. He ran to the cave with hasty steps, and called the daughter of Conloch. Where art thou, my love? but no answer.—He marked, at length, her heaving heart beating against the mortal arrow. O Conloch's daughter, is it thou! he sunk upon her breast.

"The hunters found the hapless pair. Many and silent were his steps round the dark dwellings of his love. The fleet of the ocean came: he fought, and the strangers fell: he searched for death over the

field; but who could kill the mighty Comal? Throwing away his shield, an arrow found his manly breast. He sleeps with his Galvina: their green tombs are seen by the mariner, when he bounds on the waves of the north."

24. Next, upon the peculiarities of a *dramatic poem*. And the first we shall mention is a double plot: one of which most resemble an episode in an epic poem; for it would distract the spectator, instead of entertaining him, if he were forced to attend, at the same time, to two capital plots equally interesting. And even supposing it an under-plot like an episode, it seldom hath a good effect in tragedy, of which simplicity is a chief property; for an interesting subject that engages our affections, occupies our whole attention, and leaves no room for any separate concern. Variety is more tolerable in comedy; which pretends only to amuse, without totally occupying the mind. But even there, to make a double plot agreeable, is no slight effort of art: the under-plot ought not to vary greatly in its tone from the principal; for discordant emotions are unpleasant when jumbled together; which, by the way, is an insuperable objection to *tragi-comedy*. Upon that account, the *Provok'd Husband* deserves censure: all the scenes that bring the family of the Wrongheads into action, being ludicrous and farcical, are in a very different tone from the principal scenes, displaying severe and bitter expostulations between Lord Townley and his lady. The same objection touches not the double plot of the *Careless Husband*; the different subjects being sweetly connected, and having only so much variety as to resemble shades of colours harmoniously mixed. But this is not all. The under-plot ought to be connected with that which is principal, so much at least as to employ the same persons: the under-plot ought to occupy the intervals or pauses of the principal action; and both ought to be concluded together. This is the case of the *Merry Wives of Windsor*.

Violent action ought never to be represented on the stage. While the dialogue goes on, a thousand particulars concur to delude us into an impression of reality; genuine sentiments, passionate language, and persuasive gesture: the spectator once engaged, is willing to be deceived, loses sight of himself, and without scruple enjoys the spectacle as a reality. From this absent state, he is roused by violent action: he wakes as from a pleasing dream, and, gathering his senses about him, finds all to be a fiction. Horace delivers the same rule; and sounds it upon the same reason:

Ne pueros coram populo Medea trucidet;  
Aut humana palam coquat exta nefarius Atreus;  
Aut in avem Progne vertatur, Cadmus in anguem:  
Quodcumque ostendis mihi sic, incredulus odi.

The French critics join with Horace in excluding blood from the stage; but, overlooking the most substantial objection, they urge only, that it is barbarous and shocking to a polite audience. The Greeks had

(κ) Homer's description of the shield of Achilles is properly introduced at a time when the action relents, and the reader can bear an interruption. But the author of *Telemachus* describes the shield of that young hero in the heat of battle; a very improper time for an interruption.

no notion of such delicacy, or rather effemiacy; witness the murder of Clytemnestra by her son Orestes, passing behind the scene, as represented by Sophocles: her voice is heard calling out for mercy, bitter expostulations on his part, loud shrieks upon her being stabbed, and then a deep silence. An appeal may be made to every person of feeling, whether this scene be not more horrible, than if the deed had been committed in sight of the spectators upon a sudden gust of passion. If Corneille, in representing the affair between Horatius and his sister, upon which the murder ensues behind the scene, had no other view but to remove from the spectators a shocking action, he was guilty of a capital mistake: for murder in cold blood, which in some measure was the case as represented, is more shocking to a polite audience, even where the conclusive stab is not seen, than the same act performed in their presence by violent and unpremeditated passion, as suddenly repented of as committed. Addison's observation is just\*, That no part of this incident ought to have been represented, but reserved for a narrative, with every alleviating circumstance in favour of the hero.

\* Spectator,  
No 44.

25. A few words upon the dialogue, which ought to be so conducted as to be a true representation of nature. We talk not here of the sentiments, nor of the language, (which are treated elsewhere): but of what properly belongs to dialogue-writing; where every single speech, short or long, ought to arise from what is said by the former speaker, and furnish matter for what comes after, till the end of the scene. In this view, all the speeches, from first to last, represent so many links of one regular chain. No author, ancient or modern, possesses the art of dialogue equal to Shakespeare. Dryden, in that particular, may justly be placed as his opposite. He frequently introduces three or four persons speaking upon the same subject, each throwing out his own notions separately, without regarding what is said by the rest: take for an example the first scene of *Aurenczebo*. Sometimes he makes a number club in relating an event, not to a stranger, supposed ignorant of it, but to one another, for the sake merely of speaking: of which notable sort of dialogue, we have a specimen in the first scene of the first part of the *Conquest of Granada*. In the second part of the same tragedy, scene second, the King, Abenamar, and Zulema, make their separate observations, like so many soliloquies, upon the fluctuating temper of the mob: a dialogue so uncouth, puts one in mind of two shepherds in a pastoral, excited by a prize to pronounce verses alternately, each in praise of his own mistress.

This manner of dialogue-writing, beside an unnatural air, has another bad effect: it stays the course of the action, because it is not productive of any consequence. In Congreve's comedies, the action is often suspended to make way for a play of wit.

No fault is more common among writers, than to prolong a speech after the impatience of the person to whom it is addressed ought to prompt him or her to break in. Consider only how the impatient actor is to behave in the mean time. To express his impatience in violent action without interrupting, would be unnatural; and yet to dissimble his impatience by appearing cool where he ought to be highly inflamed,

would be no less so.

Rhyme being unnatural and disgusting in dialogue, is happily banished from our theatre: the only wonder is that it ever found admittance, especially among a people accustomed to the more manly freedom of Shakespeare's dialogue. By banishing rhyme, we have gained so much as never once to dream that there can be any further improvement. And yet, however suitable blank verse may be to elevated characters and warm passions, it must appear improper and affected in the mouths of the lower sort. Why then should it be a rule, That every scene in tragedy must be in blank verse? Shakespeare, with great judgment, has followed a different rule; which is, to intermix prose with verse, and only to employ the latter where it is required by the importance or dignity of the subject. Familiar thoughts and ordinary facts ought to be expressed in plain language: to hear, for example, a footman deliver a simple message in blank verse, must appear ridiculous to every one who is not biased by custom. In short, that variety of characters and of situations, which is the life of a play, requires not only a suitable variety in the sentiments, but also in the diction.

### § 3. The Three Unities.

26. WHEN we consider the chain of causes and effects in the material world, independent of purpose, design, or thought, we find a number of incidents in succession, without beginning, middle, or end: every thing that happens is both a cause and an effect; being the effect of what goes before, and the cause of what follows: one incident may affect us more, another less; but all of them are links in the universal chain: the mind, in viewing these incidents, cannot rest or settle ultimately upon any one; but is carried along in the train without any clofe.

But when the intellectual world is taken under view, in conjunction with the material, the scene is varied. Man acts with deliberation, will, and choice: he aims at some end; glory, for example, or riches, or conquest, the procuring happiness to individuals, or to his country in general: he proposes means, and lays plans to attain the end proposed. Here are a number of facts or incidents leading to the end in view, the whole composing one chain by the relation of cause and effect. In running over a series of such facts or incidents, we cannot rest upon any one; because they are presented to us as means only, leading to some end: but we rest with satisfaction upon the end or ultimate event; because there the purpose or aim of the chief person or persons is accomplished. This indicates the beginning, the middle, and the end, of what Aristotle calls an *entire action*\*. The story naturally begins with describing those circumstances which move the person who acts the principal part to form a plan, in order to compass some desired event; the prosecution of that plan and the obstructions, carry the reader into the heat of action: the middle is properly where the action is the most involved; and the end is where the event is brought about, and the plan accomplished.

We have given the foregoing example of a plan crowned with success, because it affords the clearest conception of a beginning, a middle, and an end, in which consists *unity* of action; and indeed stricter unity cannot be imagined than in that case. But an action may have

\* Poet. c. 6.

The three  
Unities.

have unity, or a beginning, middle, and end, without so intimate a relation of parts; as where the catastrophe is different from what it is intended or desired, which frequently happens in our best tragedies. In the *Æneid*, the hero, after many obstructions, makes his plan effectual. The *Iliad* is formed upon a different model: it begins with the quarrel between Achilles and Agamemnon; goes on to describe the several effects produced by that cause; and ends in a reconciliation. Here is unity of action, no doubt, a beginning, a middle, and an end; but inferior to that of the *Æneid*: which will thus appear. The mind hath a propensity to go forward in the chain of history; it keeps always in view the expected event; and when the incidents or under-parts are connected by their relation to the event, the mind runs sweetly and easily along them. This pleasure we have in the *Æneid*. It is not altogether so pleasant to connect, as in the *Iliad*, effects by their common cause; for such connection forces the mind to a continual retrospect: looking backward is like walking backward.

If unity of action be a capital beauty in fable imitative of human affairs, a plurality of unconnected fables must be a capital deformity. For the sake of variety, we indulge an under-plot that is connected with the principal: but two unconnected events are extremely unpleasant, even where the same actors are engaged in both. Ariosto is quite licentious in that particular: he carries on at the same time a plurality of unconnected stories. His only excuse is, that his plan is perfectly well adjusted to his subject; for every thing in the *Orlando Furioso* is wild and extravagant.

Though to state facts in the order of time is natural, yet that order may be varied for the sake of conspicuous beauties. If, for example, a noted story, cold and simple in its first movements, be made the subject of an epic poem, the reader may be hurried into the heat of action; reserving the preliminaries for a conversation-piece, if thought necessary; and that method, at the same time, hath a peculiar beauty from being dramatic. But a privilege that deviates from nature ought to be sparingly indulged; and yet romance-writers make no difficulty of presenting to the reader, without the least preparation, unknown persons engaged in some arduous adventure equally unknown. In *Cassandra*, two personages, who afterward are discovered to be the heroes of the fable, start up completely armed upon the banks of the Euphrates, and engage in a single combat.

A play analysed, is a chain of connected facts, of which each scene makes a link. Each scene, accordingly, ought to produce some incident relative to the catastrophe or ultimate event, by advancing or retarding it. A scene that produceth no incident, and for that reason may be termed *barren*, ought not to be indulged, because it breaks the unity of action: a barren scene can never be entitled to a place, because the chain is complete without it. In the *Old Bachelor*, the 3d scene of act 2. and all that follow to the end of that act, are mere conversation-pieces, productive of no consequence. The 10th and 11th scenes, act 3. *Double Dealer*, and the 10th, 11th, 12th, 13th, and 14th scenes, act 1. *Love for Love*, are of the same kind. Neither is *The Way of the World* entirely guiltless of such scenes. It will be no justification, that they help to display

characters: it were better, like Dryden in his *dramatis personæ*, to describe characters beforehand, which would not break the chain of action. But a writer of genius has no occasion for such artifice: he can display the characters of his personages much more to the life in sentiment and action. How successfully is this done by Shakspeare! in whose works there is not to be found a single barren scene.

Upon the whole, it appears, that all the facts in an historical fable, ought to have a mutual connection, by their common relation to the grand event or catastrophe. And this relation, in which the unity of action consists, is equally essential to epic and dramatic compositions.

In handling unity of action, it ought not to escape observation, that the mind is satisfied with slighter unity in a picture than in a poem; because the perceptions of the former are more lively than the ideas of the latter. In Hogarth's *Enraged Musician*, we have a collection of every grating sound in nature, without any mutual connection except that of place. But the horror they give to the delicate ear of an Italian sinner, who is represented almost in convulsions, bestows unity upon the piece, with which the mind is satisfied.

How far the unities of time and of place are essential, is a question of greater intricacy. These unities were strictly observed in the Greek and Roman theatres; and they are inculcated by the French and English critics, as essential to every dramatic composition. In theory, these unities are also acknowledged by our best poets, though their practice seldom corresponds: they are often forced to take liberties, which they pretend not to justify, against the practice of the Greeks and Romans, and against the solemn decision of their own countrymen. But in the course of this inquiry it will be made evident, that in this article we are under no necessity to copy the ancients; and that our critics are guilty of a mistake, in admitting no greater latitude of place and time than was admitted in Greece and Rome.

Indeed the unities of place and time, are not, by the most rigid critics, required in a narrative poem. In such composition, if it pretend to copy nature, these unities would be absurd; because real events are seldom confined within narrow limits either of place or of time: and yet we can follow history, or an historical fable, through all its changes, with the greatest facility: we never once think of measuring the real time by what is taken in reading; nor of forming any connection between the place of action and that which we occupy.

We are aware, that the drama differs so far from the epic, as to admit different rules. It will be observed, "That an historical fable, intended for reading solely, is under no limitation of time nor of place, more than a genuine history; but that a dramatic composition cannot be accurately represented, unless it be limited, as its representation is, to one place and to a few hours; and therefore that no fable can be admitted but what has these properties, because it would be absurd to compose a piece for representation that cannot be justly represented." This argument has at least a plausible appearance; and yet one is apt to suspect some fallacy, considering that no critic, however strict, has ventured to confine the unities of place and of time within so narrow

The three  
Unities.Elem. of  
Criticism.

narrow bounds.

A view of the Grecian drama, compared with our own, may perhaps relieve us from this dilemma: if they be differently constructed, as shall be made evident, it is possible that the foregoing reasoning may not be equally applicable to both. This is an article, that, with relation to the present subject, has not been examined by any writer.

All authors agree, that tragedy in Greece was derived from the hymns in praise of Bacchus, which were sung in parts by a chorus. Thespis, to relieve the singers, and for the sake of variety, introduced one actor; whose province it was to explain historically the subject of the song, and who occasionally represented one or other personage. Elchylus, introducing a second actor, formed the dialogue; by which the performance became dramatic; and the actors were multiplied when the subject represented made it necessary. But still, the chorus, which gave a beginning to tragedy, was considered as an essential part. The first scene, generally, unfolds the preliminary circumstances that lead to the grand event; and this scene is by Aristotle termed the *prologus*. In the second scene, where the action properly begins, the chorus is introduced, which, as originally, continues upon the stage during the whole performance: the chorus frequently makes one in the dialogue; and when the dialogue happens to be suspended, the chorus, during the interval, is employed in singing. Sophocles adheres to this plan religiously. Euripides is not altogether so correct. In some of his pieces it becomes necessary to remove the chorus for a little time; but when that unusual step is risked, matters are so ordered as not to interrupt the representation: the chorus never leave the stage of their own accord, but at the command of some principal personage, who constantly waits their return.

Thus the Grecian drama is a continued representation without any interruption; a circumstance that merits attention. A continued representation without a pause, affords not opportunity to vary the place of action, nor to prolong the time of the action beyond that of the representation. To a representation so confined in place and time, the foregoing reasoning is strictly applicable: a real or feigned action that is brought to a conclusion after considerable intervals of time and frequent changes of place, cannot accurately be copied in a representation that admits no latitude in either. Hence it is, that the unities of place and of time, were, or ought to have been, strictly observed in the Greek tragedies; which is made necessary by the very constitution of their drama, for it is absurd to compose a tragedy that cannot be justly represented.

Modern critics, who for our drama pretend to establish rules founded on the practice of the Greeks, are guilty of an egregious blunder. The unities of place and of time were in Greece, as we fee, a matter of necessity, not of choice; and it is easy to show, that if we submit to such fetters, it must be from choice, not necessity. This will be evident upon taking a view of the constitution of our drama, which differs widely from that of Greece; whether more or less perfect, is a different point, to be handled afterward. By dropping the chorus, opportunity is afforded to divide the representation by intervals of time, during which the stage is evacuated and the spectacle suspended. This

qualifies our drama for subjects spread through a wide space both of time and of place: the time supposed to pass during the suspension of the representation, is not measured by the time of the suspension; and any place may be supposed, as it is not in sight: by which means, many subjects can justly be represented in our theatres, that were excluded from those of ancient Greece. This doctrine may be illustrated, by comparing a modern play to a set of historical pictures; let us suppose them five in number, and the resemblance will be complete: each of the pictures resembles an act in one of our plays: there must necessarily be the strictest unity of place and of time in each picture; and the same necessity requires these two unities during each act of a play, because during an act there is no interruption in the spectacle. Now, when we view in succession a number of such historical pictures, let it be, for example, the history of Alexander by Le Brun, we have no difficulty to conceive, that months or years have passed between the events exhibited in two different pictures, though the interruption is imperceptible in passing our eye from the one to the other; and we have as little difficulty to conceive a change of place, however great: in which view, there is truly no difference between five acts of a modern play, and five such pictures. Where the representation is suspended, we can with the greatest facility suppose any length of time or any change of place: the spectator, it is true, may be conscious, that the real time and place are not the same with what are employed in the representation; but this is a work of reflection; and by the same reflection he may also be conscious, that Garrick is not king Lear, that the playhouse is not Dover cliffs, nor the noise he hears thunder and lightning. In a word, after an interruption of the representation, it is not more difficult for a spectator to imagine a new place, or a different time, than, at the commencement of the play, to imagine himself at Rome, or in a period of time two thousand years back. And indeed, it is abundantly ridiculous, that a critic, who is willing to hold candle-light for sun-shine, and some painted canvasses for a palace or a prison, should affect so much difficulty in imagining a latitude of place or of time in the fable, beyond what is necessary in the representation.

There are, it must be acknowledged, some effects of great latitude in time that ought never to be indulged in a composition for the theatre: nothing can be more absurd, than at the close to exhibit a full-grown person who appears a child at the beginning: the mind rejects, as contrary to all probability, such latitude of time as is requisite for a change so remarkable. The greatest change from place to place hath not altogether the same bad effect: in the bulk of human affairs place is not material; and the mind, when occupied with an interesting event, is little regardless of minute circumstances: these may be varied at will, because they scarce make any impression.

At the same time, it is not here meant to justify liberty without any reserve. An unbounded licence with relation to place and time, is faulty for a reason that seems to have been overlooked, which is, that it seldom fails to break the unity of action: in the ordinary course of human affairs, single events, such as are fit to be represented on the stage, are confined to a narrow spot, and generally employ no great extent of

The three  
Unities.

The three  
Unities.

Elem. of  
Criticism.  
ch. 23.

of time: we accordingly seldom find strict unity of action in a dramatic composition, where any remarkable latitude is indulged in these particulars. It may even be admitted, that a composition which employs but one place, and requires not a greater length of time than is necessary for the representation, is so much the more perfect; because the confining an event within so narrow bounds, contributes to the unity of action, and also prevents that labour, however slight, which the mind must undergo in imagining frequent changes of place, and many intervals of time. But still we must insist, that such limitation of place and time as was necessary in the Grecian drama, is no rule to us; and therefore, that though such limitation adds one beauty more to the composition, it is at best but a refinement, which may justly give place to a thousand beauties more substantial. And we may add, that it is extremely difficult, if not impracticable, to contract within the Grecian limits, any fable so fruitful of incidents in number and variety as to give full scope to the fluctuation of passion.

It may now appear, that critics who put the unities of place and of time upon the same footing with the unity of action, making them all equally essential, have not attended to the nature and constitution of the modern drama. If they admit an interrupted representation, with which no writer finds fault, it is absurd to reject its greatest advantage, that of representing many interesting subjects excluded from the Grecian stage. If there needs must be a reformation, why not restore the ancient chorus and the ancient continuity of action? There is certainly no medium; for to admit an interruption without relaxing from the strict unities of place and of time, is in effect to load us with all the inconveniences of the ancient drama, and at the same time to withhold from us its advantages.

And therefore the only proper question is, Whether our model be or be not a real improvement? This indeed may fairly be called in question; and in order to a comparative trial, some particulars must be premised. When a play begins, we have no difficulty to adjust our imagination to the scene of action, however distant it be in time or in place; because we know that the play is a representation only. The case is very different after we are engaged: it is the perfection of representation to hide itself, to impose on the spectator, and to produce in him an impression of reality, as if he were spectator of a real event; but any interruption annihilates that impression, by rousing him out of his waking dream, and unhappily restoring him to his senses. So difficult it is to support the impression of reality, that much slighter interruptions than the interval between two acts are sufficient to dissolve the charm: in the 5th act of the *Mourning Bride*, the three first scenes are in a room of state, the fourth in a prison; and the change is operated by shifting the scene, which is done in a trice: but however quick the transition may be, it is impracticable to impose upon the spectators so as to make them conceive that they are actually carried from the palace to the prison; they immediately reflect, that the palace and prison are imaginary, and that the whole is a fiction.

From these premises, one will naturally be led, at first view, to pronounce the frequent interruptions in

the modern drama to be an imperfection. It will occur, "That every interruption must have the effect to banish the dream of reality, and with it to banish our concern, which cannot subsist while we are conscious that all is a fiction; and therefore, that in the modern drama, sufficient time is not afforded for fluctuation and swelling of passion, like what is afforded in that of Greece, where there is no interruption." This reasoning, it must be owned, has a specious appearance: but we must not become faint-hearted upon the first repulse; let us rally our troops for a second engagement.

Considering attentively the ancient drama, we find, that though the representation is never interrupted, the principal action is suspended not less frequently than in the modern drama: there are five acts in each; and the only difference is, that in the former, when the action is suspended as it is at the end of every act, opportunity is taken of the interval to employ the chorus in singing. Hence it appears, that the Grecian continuity of representation cannot have the effect to prolong the impression of reality: to banish that impression, a pause in the action while the chorus is employed in singing, is no less effectual than a total suspension of the representation.

But to open a larger view, it may be shown, that a representation with proper pauses, is better qualified for making a deep impression, than a continued representation without a pause. This will be evident from the following considerations. Representation cannot very long support an impression of reality; for when the spirits are exhausted by close attention and, by the agitation of passion, an uneasiness ensues, which never fails to banish the waking dream. Now supposing the time that a man can employ with strict attention without wandering, to be no greater than is requisite for a single act, a supposition that cannot be far from truth; it follows, that a continued representation of longer endurance than an act, instead of giving scope to fluctuation and swelling of passion, would overstrain the attention, and produce a total absence of mind. In this respect, the four pauses have a fine effect; for by affording to the audience a reasonable respite when the impression of reality is gone, and while nothing material is in agitation, they relieve the mind from its fatigue; and consequently prevent a wandering of thought at the very time possibly of the most interesting scenes.

In one article, indeed, the Grecian model has greatly the advantage: its chorus, during an interval, not only preserves alive the impressions made upon the audience, but also prepares their hearts finely for new impressions. In our theatres, on the contrary, the audience, at the end of every act, being left to trifle time away, lose every warm impression; and they begin the next act cool and unconcerned, as at the commencement of the representation. This is a gross malady in our theatrical representations; but a malady that luckily is not incurable: to revive the Grecian chorus, would be to revive the Grecian slavery of place and time; but we can figure a detached chorus coinciding with a pause in the representation, as the ancient chorus did with a pause in the principal action. What objection, for example, can there lie against music between the acts; vocal and instrumental, adapted

The three  
Unities.

Elem. of  
Criticism.  
ch. 23.

The three  
Unities.

ed to the subject? Such detached chorus, without putting us under any limitation of time or place, would recruit the spirits, and would preserve entire the tone, if not the tide, of passion: the music, after an act, should commence in the tone of the preceding passion, and be gradually varied till it accord with the tone of the passion that is to succeed in the next act. The music and the representation would both of them be gainers by their conjunction; which will thus appear. Music that accords with the present tone of mind, is, on that account, doubly agreeable; and accordingly, though music singly hath not power to raise a passion, it tends greatly to support a passion already raised. Further, music prepares us for the passion that follows, by making cheerful, tender, melancholy, or animated impressions, as the subject requires. Take for an example the first scene of the *Mourning Bride*, where soft music, in a melancholy strain, prepares us for Almeria's deep distress. In this manner, music and representation support each other delightfully: the impression made upon the audience by the representation, is a fine preparation for the music that succeeds; and the impression made by the music, is a fine preparation for the representation that succeeds. It appears evident, that by some such contrivance, the modern drama may be improved, so as to enjoy the advantage of the ancient chorus without its slavish limitation of place and time. But to return to the comparison between the ancient and the modern drama.

The numberless improprieties forced upon the Greek dramatic poets by the constitution of their drama, may be sufficient, one should think, to make us prefer the modern drama, even abstracting from the improvement proposed. To prepare the reader for this article, it must be premised, that as in the ancient drama the place of action never varies, a place necessarily must be chosen, to which every person may have access without any improbability. This confines the scene to some open place, generally the court or area before a palace; which excludes from the Grecian theatre transactions within doors, though these commonly are the most important. Such cruel restraint is of itself sufficient to cramp the most pregnant invention; and accordingly the Greek writers, in order to preserve unity of place, are reduced to woful improprieties. In the *Hippolytus* of Euripides, (act 1. sc. 6.) Phædra, distressed in mind and body, is carried without any pretext from her palace to the place of action; is there laid upon a couch, unable to support herself upon her limbs; and made to utter many things improper to be heard by a number of women who form the chorus: and what is still more improper, her female attendant uses the strongest intreaties to make her reveal the secret cause of her anguish; which at last Phædra, contrary to decency and probability, is prevailed upon to do in presence of that very chorus, (act 2. sc. 2.) Alceste, in Euripides, at the point of death, is brought from the palace to the place of action, groaning, and lamenting her untimely fate (act 2. sc. 1.) In the *Trachinians* of Sophocles, (act 2.), a secret is imparted to Dejanira, the wife of Hercules, in presence of the chorus. In the tragedy of *Iphigenia*, the messenger employed to inform Clitemnestra that Iphigenia was sacrificed, stops short at the place of action, and with a loud voice calls the

queen from her palace to hear the news. Again, in the *Iphigenia in Tauris* (act 4.), the necessary presence of the chorus forces Euripides into a gross absurdity, which is to form a secret in their hearing; and, to disguise the absurdity, much court is paid to the chorus, not one woman but a number, to engage them to secrecy. In the *Medea* of Euripides, that princefs makes no difficulty, in presence of the chorus, to plot the death of her husband, of his mistress, and of her father the king of Corinth, all by poison: it was necessary to bring Medea upon the stage; and there is but one place of action, which is always occupied by the chorus. This scene closes the second act; and in the end of the third, she frankly makes the chorus her confidants in plotting the murder of her own children. Terence, by identity of place, is often forced to make a conversation within doors be heard on the open street: the cries of a woman in labour are there heard distinctly.

The Greek poets are not less hampered by unity of time than by that of place. In the *Hippolytus* of Euripides, that prince is banished at the end of the 4th act; and in the first scene of the following act, a messenger relates to Theseus the whole particulars of the death of Hippolytus by the sea-monster: that remarkable event must have occupied many hours; and yet in the representation it is confined to the time employ'd by the chorus upon the song at the end of the 4th act. The inconsistency is still greater in the *Iphigenia in Tauris* (act 5. sc. 4.): the song could not exhaust half an hour; and yet the incidents supposed to have happened during that time, could not naturally have been transacted in less than half a day.

The Greek artists are forced, not less frequently, to transgress another rule, derived also from a continued representation. The rule is, that as a vacuity, however momentary, interrupts the representation, it is necessary that the place of action be constantly occupied. Sophocles, with regard to that rule as well as to others, is generally correct: but Euripides cannot bear such restraint; he often evacuates the stage, and leaves it empty for others. *Iphigenia in Tauris*, after pronouncing a soliloquy in the first scene, leaves the place of action, and is succeeded by Orestes and Pylades: they, after some conversation, walk off; and *Iphigenia* re-enters, accompanied with the chorus. In the *Alcestes*, which is of the same author, the place of action is void at the end of the 3d act. It is true, that to cover the irregularity, and to preserve the representation in motion, Euripides is careful to fill the stage without loss of time: but this still is an interruption, and a link of the chain broken; for during the change of the actors, there must be a space of time, during which the stage is occupied by neither set. It makes indeed a more remarkable interruption, to change the place of action as well as the actors; but that was not practicable upon the Grecian stage.

It is hard to say upon what model Terence has formed his plays. Having no chorus, there is a pause in the representation at the end of every act: but advantage is not taken of the cessation, even to vary the place of action; for the street is always chosen, where every thing passing may be seen by every person; and by that choice, the most sprightly and interesting parts of the action, which commonly pass within doors,

are

are excluded; witness the last act of the *Eunuch*. He hath submitted to the like slavery with respect to time. In a word, a play with a regular chorus, is not more confined in place and time than his plays are. Thus a zealous sectary follows implicitly ancient forms and ceremonies, without once considering whether their introductive cause be still subsisting. Plautus, of a bolder genius than Terence, makes good use of the liberty afforded by an interrupted representation: he varies the place of action upon all occasions, when the variation suits his purpose.

The intelligent reader will by this time understand, that we plead for no change of place in our plays but after an interval, nor for any latitude in point of time but what falls in with an interval. The unities of place and time ought to be strictly observed during each act; for during the representation, there is no opportunity for the smallest deviation from either. Hence it is an essential requisite, that during an act the stage be always occupied; for even a momentary vacuity makes an interval or interruption. Another rule is no less essential: it would be a gross breach of the unity of action, to exhibit upon the stage two separate actions at the same time; and therefore, to preserve that unity, it is necessary that each personage introduced during an act, be linked to those in possession of the stage, so as to join all in one action. These things follow from the very conception of an act, which admits not the slightest interruption: the moment the representation is intermitted, there is an end of that act; and we have no other notion of a new act, but where, after a pause or interval, the representation is again put in motion. French writers, generally speaking, are correct in this particular. The English, on the contrary, are so irregular as scarce to deserve a criticism: actors not only succeed each other in the same place without connection, but what is still less excusable, they frequently succeed each other in different places. This change of place in the same act, ought never to be indulged; for, beside breaking the unity of the act, it has a disagreeable effect: after an interval, the imagination adapts itself to any place that is necessary, as readily as at the commencement of the play; but during the representation, we reject change of place. From the foregoing censure must be excepted the *Mourning Bride* of Congreve, where regularity concurs with the beauty of sentiment and of language, to make it one of the most complete pieces England has to boast of. It is to be acknowledged, however, that, in point of regularity, this elegant performance is not altogether unexceptionable. In the four first acts, the unities of place and time are strictly observed: but in the last act, there is a capital error with respect to unity of place; for in the three first scenes of that act, the place of action is a room of state, which is changed to a prison in the fourth scene: the chain also of the actors is broken; as the persons introduced in the prison, are different from those who made their appearance in the room of state. This remarkable interruption of the representation, makes in effect two acts instead of one: and therefore, if it be a rule that a play ought not to consist of more acts than five, this performance is so far defective in point of regularity. It may be added, that, even admitting six acts, the irregularity

would not be altogether removed, without a longer pause in the representation than is allowed in the acting; for more than a momentary interruption is requisite for enabling the imagination readily to fall in with a new place, or with a wide space of time. In *The Way of the World*, of the same author, unity of place is preserved during every act, and a stricter unity of time during the whole play than is necessary.

## § 4. Of the Opera.

51. An opera is a drama represented by music. This entertainment was invented at Venice. An exhibition of this sort requires a most brilliant magnificence, and an expence truly royal. The drama must necessarily be composed in verse; for as operas are sung and accompanied with symphonies, they must be in verse to be properly applicable to music. To render this entertainment still more brilliant, it is ornamented with dances and balletes, with superb decorations, and surprising machinery. The dresses of the actors, of those who assist in the chorus, and of the dancers, being all in the most splendid and elegant taste, contribute to render the exhibition highly sumptuous. But notwithstanding this union of arts and pleasures at an immense expence, and notwithstanding a most dazzling pageantry, an opera appears, in the eyes of many people of taste, but as a magnificent absurdity, seeing that nature is never there from the beginning to the end. It is not our business here, however, to determine between the different tastes of mankind.

The method of expressing our thoughts by singing and music is so little natural, and has something in it so forced and affected, that it is not easy to conceive how it could come into the minds of men of genius to represent any human actions, and what is more, a serious or tragic action, any otherwise than by speech. We have, it is true, operas in English by Addison; &c. in Italian by Metastasio, in French by M. Quinault, Fontenelle, &c. the subjects of which are so grave and tragic, that one might call them musical tragedies, and *real chefs-d'œuvres* in their kind. But though we are highly satisfied and greatly affected on reading them, and are much pleased with seeing them represented, yet the spectator is, perhaps, more charmed with the magnificence of the light and the beauty of the music, then moved with the action and the tragical part of the performance. We are not, however, of that order of critics who strive to prove, that mankind act wrong in finding pleasure in an object with which they are really pleased; who blame a lover for thinking his mistress charming, when her features are by no means regular; and who are perpetually applying the rules of logic to the works of genius: we make these observations merely in order to examine if it be not possible to augment the pleasures of a polite people, by making the opera something more natural, more probable, and more consonant to reason.

We think, therefore, that the poet should never, or at least very rarely, choose a subject from history, but from fable or mythology, or from the regions of enchantment. Every rational mind is constantly shocked to hear a mutilated hero trill out, from the slender pipe of a chaffinch, *To arms! To arms!* and in the

same tone animate his soldiers, and lead them to the assault; or harangue an assembly of grave senators, and sometimes a whole body of people. Nothing can be more burlesque than such exhibitions; and a man must be possessed of a very uncommon sensibility to be affected by them. But as we know not what was the language of the gods, and their manner of expressing themselves, we are at liberty in that case to form what illusions we please, and to suppose that they sung to distinguish themselves from mortals. Besides, all the magic of decorations and machinery become natural, and even necessary, in these kinds of subjects; and therefore readily afford opportunity for all the pomp of these performances. The chorus, the dances, the balletes, the symphonies and dresses, may likewise be all made to correspond with such subjects: nothing is here affected, absurd, or unnatural. Whoever is possessed of genius, and is well acquainted with mythology, will there find an inexhaustible source of subjects highly diversified, and quite proper for the drama of an opera.

We shall not speak here of that sort of music which appears to us the most proper for such a drama, and of the several alterations of which we think it susceptible, in order to make it more complete, and to adapt it to a more pathetic, more noble, and more natural expression, as well in the recitatives, as in the airs and chorus. We have only here to consider the business of the poet. He should never lose sight of nature, even in the midst of the greatest fiction. A god, a demi-god, a renowned hero, such for example as Renaud in *Armida*, a fairy, a genie, a nymph, or fury, &c. should constantly be represented according to the characters we give them, and never be made to talk the language of a fop or a *petite maitresse*. The recitative, which is the ground-work of the dialogue, requires verses that are free and not regular, such as with a simple cadence approach the nearest to common language. The airs should not be forced into the piece, nor improperly placed for the sake of terminating a scene, or to display the voice of a performer: they should express some sentiment, or some precept, short and striking, or tender and affecting; or some simile lively and natural; and they should arise of themselves from a monologue, or from a scene between two persons: prolixity should here be particularly avoided, especially when such an air makes part of a dialogue; for nothing is more insipid or disgusting than the countenances of the other actors who appear at the same time, whose silence is quite unmeaning, and who know not what to do with their hands and feet while the singer is straining his throat. The verse of all the airs should be of the lyric kind, and should contain some poetic image, or paint some noble passion, which may furnish the composer with an opportunity of displaying his talents, and of giving a lively and affecting expression to the music. A phrase that is inanimated can never have a good effect in the performance, but must become insipid and horribly tedious in the air. The trite similes of the Italians of a stream that flows, or a bird that flies, &c. are no longer sufferable. The same thing may be said with regard to the chorus, which should be equally natural and well adapted: it is here sometimes a whole people, sometimes the inhabitants of a peculiar country,

and sometimes warriors, nymphs, or priests, &c. who raise their voice to demand justice, to implore favour, or render a general homage. The action itself will furnish the poet of genius with ideas, words, and the manner of disposing them.

Lastly, the opera being a performance calculated less to satisfy the understanding, than to charm the ear and affect the heart, and especially to strike the sight, the poet should have a particular attention to that object, should be skilled in the arts of a theatre, should know how to introduce combats, balletes, feasts, games, pompous entries, solemn processions, and such marvellous incidents as occur in the heavens, upon earth, in the sea, and even in the infernal regions: but all these matters demand a strong character, and the utmost precision in the execution; for otherwise, the comic being a near neighbour to the sublime, they will easily become ridiculous. The unity of action must certainly be observed in such a poem, and all the incidental episodes must concur to the principal design; otherwise it would be a monstrous chaos. It is impossible, however, scrupulously to observe the unity of time and place: though the liberty, which reason allows the poet in this respect, is not without bounds; and the less use he makes of it, the more perfect his poem will be. It is not perhaps impossible so to arrange the objects, that, in changing the decorations, the painter may constantly make appear some part of the principal decoration which characterises the situation of the scene, as the corner of a palace at the end of a garden, or some avenue that leads to it, &c. But all this is liable to difficulties, and even to exceptions; and the art of the painter must concur in such case with that of the poet. For the rest, all the operas of Europe are at least one third too long; especially the Italian. The unity of action requires brevity; and satiety is inseparable from a diversion that lasts full four hours, and sometimes longer. They have indeed endeavoured to obviate this inconvenience by dividing an opera into three, and even into five acts; but experience proves, that this division, though judicious, is still not sufficient to relieve the wearied attention.

#### SECT. II. Of Lyric Poetry.

52. THE ode is very ancient, and was probably the first species of poetry. It had its source, we may suppose, from the heart, and was employed to express, with becoming fervour and dignity, the grateful sense man entertained of the blessings which daily flowed from God the fountain of all goodness: Hence their harvest hymns, and other devotional compositions of that kind.

But in process of time it was employed, not only to praise the Almighty for bounties received, but to solicit his aid in time of trouble; as is plain from the odes written by king David and others, and collected by the Jewish Sanhedrim into the book of *Psalms*, to be sung at their fasts, festivals, and on other solemn occasions. Nor was this practice confined to the *Israelites* only: Other nations had their songs of praise and petitions of this sort, which they preferred to their deities in time of public prosperity and public distress, as well as to those heroes who distinguished themselves in arms. Even the *American Indians*, whose notions

of religion are extremely confined, have their war-songs, which they sing to this day.

It is reasonable to suppose that the awful purpose to which the ode was applied, gave rise among the ancients to the custom of invoking the muses; and that the poets, in order to raise their sentiments and language, so as to be acceptable to their deities, thought it expedient to solicit some divine assistance. Hence poets are said to have been inspired, and hence an unbounded liberty has been given to the ode; for the lyric poet, fired, as it were, with his subject, and borne away on the wings of gratitude, disdains grammatical niceties and common modes of speech, and often soars above rule, though not above reason. This freedom, however, consists chiefly in sudden transitions, bold digressions, and lofty excursions. For the ancient poets, and even Pindar, the most daring and lofty of them all, has in his sublimest flights, and amidst all his rapture, preserved harmony, and often uniformity in his versification; but so great is the variety of his measures, that the traces of famenets are in a manner lost; and this is one of the excellencies for which that poet is admired, and which, though seemingly devoid of art, requires so much that he has seldom been imitated with success.

The ancients in their odes indulged such a liberty of fancy, that some of their best poets not only make bold excursions and digressions, but, having in their flights started some new and noble thought, they frequently pursue it, and never more return to their subject. But this loose kind of ode, which seems to reject all method, and in which the poet, having just touched upon his subject, immediately diverts to another, we should think blameable, were it lawful to call in question the authority of those great men who were our preceptors in this art. We may venture to affirm, however, that these compositions stand in no degree of comparison with other odes of theirs; in which, after wandering from the subject in pursuit of new ideas arising from some of its adjuncts, and ranging wantonly, as it were, through a variety of matter, the poet is, from some other circumstance, led naturally to his subject again; and, like a bee, having collected the essence of many different flowers, returns home and unites them all in one uniform pleasing sweet.

The ode among the ancients signified no more than a song: but with the moderns, the ode and the song are considered as different compositions; the ode being usually employed in grave and lofty subjects, and seldom sung but on solemn occasions.

The subjects most proper for the ode and song, Horace has pointed out in a few elegant lines.

Gods, heroes, conquerors, *Olympic* crowns,  
Love's pleasing cares, and the free joys of wine,  
Are proper subjects for the lyric song.

To which we may add, that happiness, the pleasures of a rural life, and such parts of morality as afford lessons for the promotion of our felicity, and reflections on the conduct of life, are equally suitable to the ode. This both *Pindar* and *Horace* were so sensible of, that many of their odes are seasoned with these moral sentences and reflections.

But who can number ev'ry sandy grain  
Wash'd by *Sicilia's* hoarse-resounding main?  
Or who can *Theron's* gen'rous works expels,  
And tell how many hearts his bounteous virtues blest?

*Ode to* HERON.

And in another *Olympic* ode, inscribed by the same poet to *Diagoras* of *Rhodes* (and in such esteem, that it was deposited in the temple of *Minerva*, written in letters of gold), *Pindar*, after exalting them to the skies, concludes with this lesson in life:

Yet as the gales of fortune various blow,  
To day tempestuous, and to-morrow fair,  
Due bounds, ye *Rhodians*, let your transports know;  
Perhaps to-morrow comes a storm of care.

*West's* PINDAR.

The man resolv'd and steady to his trust,  
Inflexible to ill, and obstinately just,  
May the rude rabble's insolence despise,  
Their senseless clamours and tumultuous cries;  
The tyrant's fierceness he beguiles,  
And the stern brow and the harsh voice defies,  
And with superior greatness smiles.

Not the rough whirlwind, that deforms  
*Adria's* black gulf, and vexes it with storms,  
The stubborn virtue of his soul can move;  
Nor the red arm of angry *Jove*,  
That flings the thunder from the sky,  
And gives it rage to roar and strength to fly.  
Should the whole frame of nature round him break,  
In ruin and confusion hurl'd,  
He unconcern'd would hear the mighty crack,  
And stand secure amidst a falling world.

HORACE.

*M. Despreaux* has given us a very beautiful and just description of the ode in these lines.

L'Ode avec plus d'éclat, & non moins d'énergie  
Elevait jusqu'au ciel son vol ambitieux,  
Entretient dans vers commerce avec les Dieux.  
Aux Athletes dans Pise elle ouvre la barrière,  
Chante un vainqueur poudreux au bout de la carrière;  
Mène Achille sanglant au bords du Simois  
Ou fait flechir l'Eclat sous le joug de Louis.  
Tantôt comme une abeille ardente à son ouvrage  
Elle s'en va de fleurs dépouiller le rivage:  
Elle peint les festins, les danses & les ris,  
Vante un baiser cueilli sur les lèvres d'Iris,  
Qui mollement résiste & par un doux caprice  
Quelquefois le refuse, afin qu'on le ravisse.  
Son style impetueux souvent marche au hasard.  
Chez elle un beau desordre est un effet de l'art,  
Loin ces rimeurs éraintifs, dont l'elpetir plegmatique  
Garde dans ses fureurs un ordre didactique:  
Qui chantant d'un heros les progrès éclatans,  
Maigres historiens, suivront l'ordre des temps.  
Apollon de son feu leur fut toujours avare, &c.

The lofty ode demands the strongest fire,  
For there the muse all Phœbus must inspire:  
Mounting to heav'n in her ambitious flight,  
Amongst the Gods and heroes takes delight;  
Of Pisa's wrestlers tells the sinewy force,  
And sings the dusty conqueror's glorious course;

To Simois' banks now fierce Achilles sends,  
Beneath the Gallic yoke now Eëaunt bends:  
Sometimes she flies, like an industrious bee,  
And robs the flow'rs by nature's chemist'ry;  
Describes the shepherd's dances, feasts, and bliss,  
And boasts from Phillis to surprize a kiss,  
When gently she resists with feign'd remorse,  
That what she grants may seem to be by force.  
Her generous style will oft at random start  
And by a brave disorder show her art;  
Unlike those fearful poets whose cold rhyme  
In all their raptures keeps exactest time,  
Who sing the illustrious hero's mighty praise,  
Dry journalists, by terms of weeks and days;  
'To thee, Apollo, thrifts of his fire,  
Denies a place in the Pierian choir, &c.

SOAMES.

The variety of subjects, which are allowed the *lyric* poet, makes it necessary to consider this species of poetry under the following heads, viz. the *sublime* ode, the *lesser* ode, and the *song*. We shall begin with the lowest, and proceed to that which is more eminent.

54. I. *Songs* are little poetical compositions, usually set to a tune, and frequently sung in company by way of entertainment and diversion. Of these we have in our language a great number; but, considering that number, not many which are excellent; for, as the duke of Buckingham observes,

Tho' nothing seems more easy, yet no part  
Of poetry requires a nicer art.

The song admits of almost any subject; but the greatest part of them turn either upon *love*, *contentment*, or the *pleasures of a country life*, and *drinking*. Be the subject, however, what it will, the verses should be easy, natural, and flowing, and contain a certain harmony, so that poetry and music may be agreeably united. In these compositions, as in all others, obscene and profane expressions should be carefully avoided, and indeed every thing that tends to take off that respect which is due to religion and virtue, and to encourage vice and immorality. As the best songs in our language are already in every hand, it would seem superfluous to insert examples. For further precepts, however, as well as select examples, in this species of composition, we may refer the reader to the elegant *Essay on Song writing*, by Mr Aikin.

55. II. The *lesser ode*. The distinguishing character of this is sweetness; and as the pleasure we receive from this sort of poem, arises principally from its soothing and affecting the passions, great regard should be paid to the language, as well as to the thoughts and numbers.

The expression should be easy, fancy high;  
Yet that not seem to creep, nor this to fly;  
No words transpos'd, but in such order all,  
As, tho' hard wrought, may seem by chance to fall.  
D. Buckingham's *Essay*.

The style, indeed, should be easy: but it may be also florid and figurative. It solicits delicacy, but disdains affectation. The thoughts should be natural, chaste, and elegant; and the numbers various, smooth, and harmonious. A few examples will sufficiently explain what we mean.

Longinus has preserved a fragment of *Sappho*, an ancient Greek poetess, which is in great reputation amongst the critics, and has been so happily translated by Mr Philips, as to give the English reader a just idea of the spirit, ease, and elegance of that admired author; and show how exactly the copied nature. To enter into the beauties of this ode, we must suppose a lover sitting by his mistress, and thus expressing his passion:

Blest as th' immortal gods is he,  
The youth who fondly sits by thee,  
And sees and hears thee all the while  
Softly speak, and sweetly smile.  
'Twas this depriv'd my soul of rest,  
And rais'd such tumults in my breast;  
For while I gaz'd, in transport tost,  
My breath was gone, my voice was lost.  
My bosom glow'd, the subtle flame  
Ran quick through all my vital frame:  
O'er my dim eyes a darkness hung;  
My ears with hollow murmurs rung.  
In dewy damps my limbs were chill'd;  
My blood with gentle horrors thrill'd;  
My feeble pulse forgot to play;  
I fainted, sunk, and dy'd away.

After this instance of the *Sapphic* ode, it may not be improper to speak of that sort of ode which is called *Anacreontic*; being written in the manner and taste of *Anacreon*, a Greek poet, famous for the delicacy of his wit, and the exquisite, yet easy and natural turn of his poetry. We have several of his odes still extant, and many modern ones in imitation of him, which are mostly composed in verses of seven syllables, or three feet and a half.

We shall give the young student one or two examples of his manner from Mr Fawkes's excellent translation.

The following ode on the power of gold, which had been often attempted with but little success, this gentleman has translated very happily.

Love's a pain that works our woe;  
Not to love, is painful too:  
But, alas! the greatest pain  
Waits the love that meets disdain.  
What avails ingenuous worth,  
Sprightly wit, or noble birth?  
All these virtues useless prove;  
Gold alone engages love.

May he be completely curst,  
Who the sleeping mischief first  
Wak'd to life, and, vile before,  
Stamp'd with worth the sordid ore.  
Gold creates in brethren strife;  
Gold destroys the parent's life;  
Gold produces civil jars,  
Murders, massacres, and wars;  
But, the worst effect of gold,  
Love, alas! is bought and sold.

His ode on the vanity of riches, is of a piece with the above, and conveys a good lesson to those who are over anxious for wealth.

If the treasur'd gold could give  
Man a longer term to live,

I'd employ my utmost care  
Still to keep, and fill to spare;  
And, when death approach'd, would say,  
'Take thy fee, and walk away.'

But since riches cannot save  
Mortals from the gloomy grave,  
Why should I myself deceive,  
Vainly sigh, and vainly grieve?  
Death will surely be my lot,  
Whether I am rich or not.

Give me freely while I live  
Generous wines, in plenty give  
Soothing joys my life to cheer,  
Beauty kind, and friends sincere;  
Happy! could I ever find  
Friends sincere, and beauty kind.

But two of the most admired, and perhaps the most imitated, of Anacreon's odes, are that of Mars wounded by one of the darts of Love, and Cupid stung by a Bee; both which are wrought up with fancy and delicacy, and are translated with elegance and spirit.—Take that of Cupid stung by a bee.

Once as Cupid, tir'd with play,  
On a bed of roses lay,  
A rude bee, that slept unseen,  
The sweet-breathing buds between,  
Stung his finger, cruel chance!  
With its little pointed lance.  
Strait he fills the air with cries,  
Weeps, and sobs, and runs, and flies;  
'Till the god to Venus came,  
Lovely, laughter-loving dame:  
Then he thus began to plain;  
"Oh! undone,—I die with pain—  
"Dear mamma, a serpent small,  
"Which a Bee the ploughmen call,  
"Imp'd with wings, and arm'd with dart,  
"Oh!—has stung me to the heart."  
Venus thus reply'd, and smil'd:  
'Dry those tears for shame! my child;  
'If a bee can wound so deep,  
'Causing Cupid thus to weep,  
'Think, O think! what cruel pains  
'He that's stung by thee sustains.'

Mr Prior, whose poetical works will be ever admired for the natural ease and elegance of his style, as well as for the delicacy of his wit, has in several of his odes the very spirit and air of Anacreon. The following ode, in which he describes the effects of love, and insinuates that the eyes are the best interpreters of the heart, is written exactly in his manner.

The merchant, to secure his treasure,  
Conveys it in a borrow'd name:  
Euphelia serves to grace my measure;  
But Chloe is my real fame.  
My softest verse, my darling lyre,  
Upon Euphelia's toilet lay;  
When Chloe noted her desire,  
That I should sing, that I should play.  
My lyre I tune, my voice I raise;  
But with my numbers mix my sighs;  
And whilst I sing Euphelia's praise,  
I fix my soul on Chloe's eyes.

Fair Chloe blush'd: Euphelia frown'd:  
I sung and gaz'd; I play'd and trembled:  
And Venus, to the Loves around,  
Remark'd how ill we all dissembled.

This ingenious author has given us several odes in the spirit and manner of Horace, as well as of Anacreon; and the following *Answer to Chloe jealous*, which was written when he was sick, has much of the elegant tenderness of Sappho.

Yes, fairest proof of beauty's pow'r,  
Dear idol of my panting heart,  
Nature points this my fatal hour:  
And I have liv'd; and we must part.  
While now I take my last adieu,  
Heave thou no sigh, nor shed a tear;  
Lest yet my half-clos'd eye may view  
On earth an object worth its care.  
From jealousy's tormenting strife  
For ever be thy bosom freed;  
That nothing may disturb thy life,  
Content I hasten to the dead.  
Yet when some better-fated youth  
Shall with his am'rous parody move thee,  
Reflect one moment on his truth  
Who, dying, thus perishes to love thee.

And in the piece which immediately follows, intitled, *A better Answer to Chloe jealous*, he has, together with the gaiety and wit of Anacreon and Horace, blended some strokes of humour.

Dear Chloe, how blubber'd is that pretty face?  
Thy cheek all on fire, and thy hair all uncurl'd:  
Prishee quit this caprice; and (as old Falstaff lays)  
Let us e'en talk a little like folks of this world.  
How canst thou presume thou hast leave to destroy  
The beauties which Venus but lent to thy keeping?  
Those looks were design'd to inspire love and joy:  
More ordinary eyes may serve people for weeping.  
To be vex'd at a trifle or two that I write,  
Your judgment at once and my passion you wrong:  
You take that for fact, which will scarce be found wit:  
Od's life! must one swear to the truth of a song?  
What I speak, my fair Chloe, and what I write, shows  
The difference there is betwixt nature and art:  
I court others in verse; but I love thee in prose;  
And they have my whimsies, but thou hast my heart.  
The god of us verse-men (you know, child) the Sun,  
How after his journeys he lets up his rest;  
If at morning o'er earth 'tis his fancy to run,  
At night he reclines on his Thetis's breast.  
So when I am weary'd with wand'ring all day,  
To thee, my delight, in the evening I come;  
No matter what beauties I saw in my way,  
They were but my visits, but thou art my home.  
Then snish, dear Chloe, this pastoral war,  
And let us like Horace and Lydia agree;  
For thou art a girl as much brighter than her,  
As he was a poet sublimer than me.

There is much of the softness of Sappho, and the sweetness of Anacreon and Prior, in the following ode; which is ascribed to the late unfortunate Dr Dodd, and was written in compliment to a lady, who, being sick, had sent the author a moss rose-bud, instead

of making his family a visit. This piece is particularly to be esteemed for the just and striking moral with which it is pointed.

The slightest of favours bestow'd by the fair,  
With rapture we take, and with triumph we wear :  
But a moss-woven rose bud, Eliza, from thee,  
A well-pleasing gift to a monarch would be.  
—Ah! that illness, too cruel, forbidding thou'd stand,  
And refuse me the gift from thy own lovely hand !  
With joy I receive it, with pleasure will view,  
Reminded of thee, by its odour and hue :  
“ Sweet rose, let me tell thee, tho' charming thy bloom,  
Tho' thy fragrance excels Seba's richest perfume ;  
Thy breath to Eliza's no fragrance hath in't,  
And but dull is thy bloom to her cheek's blushing tint.  
Yet, alas! my fair flow'r, that bloom will decay,  
And all thy lov'd beauties soon wither away ;  
Tho' pluck'd by her hand, to whose touch, we must own,  
Harsh and rough is the cygnet's most delicate down : ”  
Thou too, snowy hand ;—nay, I mean not to preach ;  
But the rose, lovely moralist, suffer to teach.  
“ Extol not, fair maiden, thy beauties o'er mine ;  
They too are short-liv'd, and they too must decline ;  
And small, in conclusion, the difference appears,  
In the bloom of few days, or the bloom of few years!  
But remember a virtue the rose hath to boast,  
—Its fragrance remains when its beauties are lost ! ”

56. We come now to those odes of the more florid and figurative kind, of which we have many in our language that deserve particular commendation. Mr Warton's Ode to Fancy has been justly admired by the best judges ; for though it has a distant resemblance of Milton's L'Allegro and Il Penseroso, yet the work is original ; the thoughts are mostly new and various, and the language and numbers elegant, expressive, and harmonious.

O parent of each lovely muse,  
Thy spirit o'er my soul diffuse !  
O'er all my artless songs preside,  
My footsteps to thy temple guide !  
To offer at thy turf-built shrine  
In golden cups no costly wine,  
No murder'd fating of the flock,  
But flow'rs and honey from the rock.  
O nymph, with lock'd flowing hair,  
With buskin'd leg, and bosom bare ;  
Thy waist with myrtle-girdle bound,  
Thy brows with Indian feathers crown'd ;  
Waving in thy snowy hand  
An all-commanding magic wand,  
Of pow'r to bid fresh gardens blow  
Mid cheerless Lapland's barren snow ;  
Whose rapid wings thy flight convey,  
Thro' air, and over earth and sea ;  
While the vast various landscape lies  
Conspicuous to thy piercing eyes.  
O lover of the desert, hail !  
Say, in what deep and pathless vale,  
Or on what hoary mountain's side,  
Midst falls of water, you reside ;  
Midst broken rocks, a rugged scene,  
With green and grassy dales between ;

'Midst forests dark of aged oak,  
Ne'er echoing with the woodman's stroke ;  
Where never human art appear'd,  
Nor ev'n one straw-roof'd cott was rear'd ;  
Where Nature seems to sit alone,  
Majestic on a craggy throne.  
Tell me the path, sweet wand'rer ! tell,  
To thy unknown sequester'd cell,  
Where woodbines cluster round the door,  
Where shells and moss o'erlay the floor ;  
And on whose top an hawthorn blows,  
Amid whose thickly-woven boughs  
Some nightingale still builds her nest,  
Each ev'ning warbling thee to rest.  
Then lay me by the haunted stream,  
Wrapt in some wild, poetic dream ;  
In converse while methinks I rove  
With Spenser thro' a fairy grove ;  
Till suddenly awak'd, I hear  
Strange whisper'd music in my ear ;  
And my glad soul in bliss is drown'd,  
By the sweetly-soothing sound !  
Me, goddess, by the right-hand lead,  
Sometimes thro' the yellow mead ;  
Where Joy and white rob'd Peace resort,  
And Venus keeps her festive court ;  
Where Mirth and Youth each ev'ning meet,  
And lightly trip with nimble feet,  
Nodding their lily-crown'd heads,  
Where Laughter rose-lip'd Hebe leads ;  
Where Echo walks steep hills among,  
Lift'ning to the shepherd's song.  
Yet not these flow'ry fields of joy,  
Can long my pensive mind employ ;  
Hail, Fancy, from the scenes of Folly,  
To meet the matron Melancholy !  
Goddess of the tearful eye,  
That loves to fold her arms and sigh.  
Let us with silent footsteps go  
To charnels, and the house of woe ;  
To Gothic churches, vaults, and tombs,  
Where each sad night some virgin comes,  
With throbbing breast and faded cheek,  
Her promis'd bridegroom's urn to seek :  
Or to some abbey's mould'ring towers,  
Where, to avoid cold wintry shows,  
The naked beggar shivering lies,  
While whistling tempests round her rise,  
And trembles lest the tott'ring wall  
Should on her sleeping infants fall.

Now let us louder strike the lyre,  
For my heart glows with martial fire ;  
I feel, I feel, with sudden heat,  
My big tumultuous bosom beat ;  
The trumpet's clangors pierce my ear,  
A thousand widows shrieks I hear :  
Give me another hoise, I cry ;  
Lo, the base Gallic squadrons fly !  
Whence is this rage ?—what spirit, say,  
To battle hurries me away ?  
'Tis Fancy, in her fiery car,  
Transports me to the thickest war ;  
There whirls me o'er the hills of slain,  
Where tumult and destruction reign ;

Where,

Where, mad with pain, the wounded feed,  
Tramples the dying and the dead;  
Where giant Terror stalks around,  
With fullen joy surveys the ground,  
And, pointing to th' ensanguin'd field,  
Shakes his dreadful gorgon shield!  
O guide me from this horrid scene  
To high-arch'd walks, and alleys green,  
Which lovely Laura seeks; to shun  
The fervors of the mid-day sun.  
The pangs of absence, O remove,  
For thou can'st place me near my love;  
Can'st fold in visionary bliss,  
And let me think I steal a kiss;  
While her ruby lips dispense  
Luscious nectar's quintessence!  
When young-ey'd Spring profusely throws  
From her green lap the pink and rose;  
When the lost turtle of the dale  
To Summer tells her tender tale;  
When Autumn cooling caverns seeks,  
And stains with wine his jolly cheeks;  
When Winter, like poor pilgrim old,  
Shakes his silver beard with cold;  
At ev'ry season, let my ear  
Thy solemn whispers, Fancy, hear.  
O warm enthusiastic maid!  
Without thy pow'rful, vital aid,  
That breathes an energy divine,  
That gives a soul to ev'ry line,  
Ne'er may I strive with lips profane,  
To utter an unhallow'd strain;  
Nor dare to touch the sacred string,  
Save when with smiles thou bid'st me sing.  
O hear our pray'r, O hither come  
From thy lamented Shakespeare's tomb,  
On which thou lov'st to sit at eve,  
Musing o'er thy darling's grave.  
O queen of numbers, once again,  
Animate some chosen swain,  
Who, fill'd with unexhausted fire,  
May boldly smite the sounding lyre,  
Who with some new, unequal'd song,  
May rise above the rhyming throng;  
O'er all our list'ning passions reign,  
O'erwhelm our souls with joy and pain;  
With terror shake, with pity move,  
Rouse with revenge, or melt with love.  
O deign t' attend his evening walk,  
With him in groves and grottoes talk;  
Teach him to scorn, with frigid art,  
Feebly to touch th' enraptur'd heart;  
Like light'ning, let his mighty verse  
The bosom's inmost foldings pierce;  
With native beauties win applause,  
Beyond cold critics' studied laws:  
O let each muse's fame increase,  
O bid Britannia rival Greece!

The following ode, written by Mr. Smart on the 5th of December, (being the birth-day of a beautiful young lady), is much to be admired for the variety and harmony of the numbers, as well as for the beauty of the thoughts, and the elegance and delicacy of the compliment. It has great fire, and yet great

Hail, eldest of the monthly train,  
Sire of the winter drear,  
December! in whose iron reign  
Expires the chequer'd year.  
Hush all the blust'ring blasts that blow,  
And proudly plumb'd in silver snow,  
Smile gladly on this blest of days;  
The livery'd clouds shall on thee wait,  
And Phœbus shine in all his state  
With more than summer rays.  
Tho' jocund June may jultly boast  
Long days and happy hours;  
Tho' August be Pomona's host,  
And May be crown'd with flow'rs:  
Tell June, his fire and crimson dies,  
By Harriot's blush, and Harriot's eyes,  
Eclips'd and vanquish'd, fade away;  
Tell August, thou canst let him see  
A richer, riper fruit than he,  
A sweeter flow'r than May.

The ensuing ode, written by Mr Collins on the death of Mr Thompson, is of the pastoral and elegiac kind, and both picturesque and pathetic. To perceive all the beauties of this little piece, which are indeed many, we must suppose them to have been deliver'd on the river Thames near Richmond.

In yonder grave a Druid lies,  
Where slowly winds the stealing wave;  
The year's best sweets shall duteous rise  
To deck its poet's sylvan grave!  
In yon deep bed of whisp'ring reeds  
His airy harp \* shall now be laid,  
That he, whose heart in sorrow bleeds,  
May love thro' life the soothing shade.  
Then maids and youths shall linger here,  
And, while its sounds at distance swell,  
Shall sadly seem in pity's ear  
To hear the woodland pilgrim's knell.  
Remembrance oft shall haunt the shore,  
When Thames in summer wreaths is dress'd,  
And oft suspend the dashing oar,  
To bid his gentle spirit rest!  
And oft as ease and health retire  
To breezy lawn, or forest deep,  
The friend shall view yon whitening spire †,  
And 'mid the varied landscape weep.  
But thou, who own'st that earthy bed,  
Ah! what will ev'ry dirge avail?  
Or tears, which love and pity shed,  
That mourn beneath the gliding sail?  
Yet lives there one, whose heedless eye,  
Shall scorn thy pale shrine glimm'ring near?  
With him, sweet bard, may fancy die,  
And joy desert the blooming year.  
But thou, lorn stream, whose sullen tide  
No fedge-crown'd sisters now attend,  
Now waft me from the green hill's side,  
Whose cold turf hides the buried friend.  
And see, the fairy valleys fade,  
Dim night has veil'd the solemn view!  
Yet once again, dear parted shade,  
Meek nature's child, again adieu!

\* The harp  
of Æolus.

† Rich-  
mond-  
church

The genial meads, assign'd to blefs  
Thy life, shall mourn thy early doom;  
Their hinds, and shepherd girls, shall drefs,  
With fimple hands thy rural tomb.  
Long, long, thy ftone and pointed clay  
Shall melt the mufing Briton's eyes;  
O vales and wild woods, thou fhall fay,  
In yonder grave your Druid lies!

57. Under this fpecies of the ode, notice ought to be taken of thofe written on divine fubjects, and which are ufually called *hymns*. Of thefe we have many in our language, but none perhaps that are fo much admired as Mr Addifon's. The beauties of the following hymn are too well known, and too obvious, to need any commendation; we fhall only obferve, therefore, that in this hymn (intended to difplay the power of the Almighty) he feems to have had a pfalm of David in his view, which fays, that "the heavens declare the glory of God, and the firmament fheweth his handy-work."

The fpacious firmament on high,  
With all the blue etherial fky,  
And fparngled heav'ns, a fhining frame,  
Their great original proclaim:  
Th' unwearied fun, from day to day,  
Does his Creator's pow'r difplay,  
And publifhes to ev'ry land  
The work of an Almighty hand.

Soon as the ev'ning fhades prevail,  
The moon takes up the wond'rous tale,  
And nightly to the lift'ning earth  
Repeats the ftory of her birth:  
While all the ftars that round her burn,  
And all the planets in their turn,  
Confirm the tidings as they roll,  
And fpread the truth from pole to pole.

What tho' in folemn f Silence all  
Move round the dark terreftial ball?  
What tho' no real voice or found  
Amid their radiant orb be found?  
In reafon's ear they all rejoice,  
And utter forth a glorious voice,  
For ever fingings, as they fhine,  
"The hand that made us is divine."

The following pastoral hymn is a verfion of the 23d *Pfalm* by Mr Addifon; the peculiar beauties of which have occasioned many translations; but we have feen none that is fo poetical and perfect as this. And in juftice to Dr Boyce, we muft obferve, that the mufic he has adapted to it is fo fweet and expreffive, that we know not which is to be moft admired, the poet or the musician.

The Lord my pafture fhall prepare,  
And feed me with a fhepherd's care;  
His prefence fhall my wants fupply,  
And guard me with a watchful eye;  
My noon-day walks he fhall attend,  
And all my midnight hours defend.  
When in the fultry glebe I faint,  
Or on the thirfty mountain pant,  
To fertile vales and dewy meads,  
My weary wand'ring fteps he leads;  
Where peaceful rivers foft and flow,

Amid the verdant landfkip flow.  
Tho' in the paths of death I tread,  
With gloomy horrors overfpread,  
My ftadfaft heart fhall fear no ill:  
For thou, O Lord, art with me ftill;  
Thy friendly crook fhall give me aid,  
And guide me through the dreadful fhade.  
Tho' in a bare and rugged way,  
Through devous lonely wilds I ftay,  
Thy bounty fhall my pains beguile;  
The barren wildernefs fhall fmile,  
With fudden greens and herbage crown'd;  
And ftreams fhall murmur all around.

58. III. We are now to fpeak of thofe odes which are of the fublime and noble kind, and diftinguifhed from others by their elevation of thought and diftion, as well as by the variety or irregularity of their numbers, as the frequent transitions and bold excursions with which they are enriched.

To give the young ftudent an idea of the fudden and frequent transitions, digreffions, and excursions, which are admitted into the odes of the ancients, we cannot do better than refer him to the celebrated fong, or ode, of Moles; which is the eldeft that we know of, and was penned by that divine author immediately after the children of Ifrael croffed the Red-Sea.

At the end of this fong, we are told, that "Miriam the prophetefs, the filler of Aaron, took a timbrel in her hand, and all the women went out after her with timbrels and with dances. And Miriam answered them, Sing ye to the Lord, for he hath triumphed gloriously; the horfe and his rider hath he thrown into the fea."

From this laft paffage it is plain, that the ancients, very early, called in mufic to the aid of poetry; and that their odes were ufually fung, and accompanied with their lutes, harps, lyres, timbrels, and other inftruments: nay, fo effential, and in fuch reputation, was mufic held by the ancients, that we often find in their lyric poets, addreffes or invocations to the harp, the lute, or the lyre; and it was probably owing to the frequent ufe made of the laft-mentioned inftrument with the ode, that this fpecies of writing obtained the name of *Lyric poetry*.

This ode, or hymn, which fome believe was compofed by Moles in Hebrew verfe, is incomparably better than anything the heathen poets have produced of the kind, and is by all good judges confidered as a matter-piece of ancient eloquence. The thoughts are noble and fublime: the ftyle is magnificent and expreffive: the figures are bold and animated: the transitions and excursions are fudden and frequent; but they are fhort, and the poet, having digreffed for a moment, returns immediately to the great object that excited his wonder, and elevated his foul with joy and gratitude. The images fill the mind with their greatnefs, and ftrike the imagination in a manner not to be expreffed. It has not indeed the meafure, cadence, and harmony, which we meet with in fome of the Greek and Latin poets; but thefe, perhaps, may, in fome meafure, have been loft in the tranflation.

59. We come now to the *Pindaric ode*, which is (if we except the hymns in the Old Teftament, and the *Pfalms* of king David) the moft exalted part of *Lyric poetry*;

poetry; and was so called from Pindar, an ancient Greek poet, who is celebrated for the boldness of his flights, the impetuosity of his style, and the seeming wildness and irregularity that runs through his compositions, and which are said to be the effect of the greatest art. (See PINDAR.)

The odes of Pindar were held in such high estimation by the ancients, that it was fabled, in honour of their sweetness, that the bees, while he was in the cradle, brought honey to his lips: nor did the victors at the Olympic and other games think the crown a sufficient reward for their merit, unless their achievements were celebrated in Pindar's songs; most wisely prefiging, that the first would decay, but the other endure for ever.

This poet did not always write his odes in the same measure, or with the same intention with regard to their being sung. For the ode inscribed to *Diagoras*, (the concluding stanza of which we inserted at the beginning of this section) is in heroic measure, and all the stanzas are equal: there are others also, as Mr *West* observes, made up of *strophes* and *antistrophes*, without any *epode*; and some composed of *strophes* only, of different lengths and measures: but the greatest part of his odes are divided into *strophe*, *antistrophe*, and *epode*; in order, as Mr *Congreve* conjectures, to their being sung, and addressed by the performers to different parts of the audience. "They were sung, says he, by a chorus, and adapted to the lyre, and sometimes to the lyre and pipe. They consisted oftentimes of three stanzas. The first was called the *strophe*, from the version or circular motion of the fingers in that stanza from the right hand to the left. The second stanza was called the *antistrophe*, from the contraversion of the chorus; the fingers in performing that, turning from the left hand to the right, contrary always to their motion in the *strophe*. The third stanza was called the *epode*, (it may be as being the after-song), which they sung in the middle, neither turning to one hand nor the other." But Dr *West*'s\* friend is of opinion, that the performers also danced one way while they were singing the *strophe*, and danced back as they sung the *antistrophe*, till they came to the same place again, and then standing still they sung the *epode*. He has translated a passage from the *Scholia* on *Hephestion*, in proof of his opinion; and observes, that the dancing the *strophe* and *antistrophe* in the same space of ground, and we may suppose the same space of time also, shows why those two parts consisted of the same length and measure.

As the various measures of Pindar's odes have been the means of so far misleading some of our modern poets, as to induce them to call compositions *Pindaric* odes, that were not written in the method of Pindar, it is necessary to be a little more particular on this head, and to give an example from that poet, the more effectually to explain his manner; which we shall take from the translation of Dr *West*.

#### The eleventh NEMEAN ODE.

This ode is inscribed to *Ariflagoras*, upon occasion of his entering on his office of president or governor of the island of *Tenedos*; so that, although it is placed among the *Nemean* odes, it has no sort of relation to those games, and is indeed properly an inauguration ode, composed to be sung by a chorus at

the sacrifices and the feasts made by *Ariflagoras* and his colleagues, in the town-hall, at the time of their being invested with the magistracy, as is evident from many expressions in the first *strophe* and *antistrophe*.

#### ARGUMENT.

Pindar opens this ode with an invocation to *Vesta* (the goddess who presided over the courts of justice, and whose statue and altar were for that reason placed in the town-halls, or *Prytaneum*, as the Greeks called them), beseeching her to receive favourably *Ariflagoras* and his colleagues, who were then coming to offer sacrifices to her, upon their entering on their office of *Prytans* or magistrates of *Tenedos*; which office continuing for a-year, he begs the goddess to take *Ariflagoras* under her protection during that time, and to conduct him to the end of it without trouble or disgrace. From *Ariflagoras*, Pindar turns himself in the next place to his father *Arcefilas*, whom he pronounces happy, as well upon account of his son's merit and honour, as upon his own great endowments and good fortune; such as beauty, strength, courage, riches, and glory resulting from his many victories in the games. But lest he should be too much puffed up with these praises, he reminds him at the same time of his mortality, and tells him that his cloathing of flesh is perishable, that he must e'er long be clothed with earth, the end of all things: and yet, continues he, it is but justice to praise and celebrate the worthy and deserving, who from good citizens ought to receive all kinds of honour and commendation; as *Ariflagoras*, for instance, who hath rendered both himself and his country illustrious by the many victories he hath obtained, to the number of sixteen, over the neighbouring youth, in the games exhibited in and about his own country. From whence, says the poet, I conclude he would have come off victorious even in the *Pythian* and *Olympic* games, had he not been restrained from engaging in those famous lifts by the too timid and cautious love of his parents. Upon which he falls into a moral reflection upon the vanity of man's hopes and fears; by the former of which they are oftentimes excited to attempts beyond their strength, which accordingly issue in their disgrace; as, on the other hand, they are frequently restrained, by unreasonable and ill-grounded fears, from enterprizes, in which they would in all probability have come off with honour. This reflection he applies to *Ariflagoras*, by saying it was very easy to foresee what success he was like to meet with, who both by father and mother was descended from a long train of great and valiant men. But here again, with a very artful turn of flattery to his father *Arcefilas*, whom he had before represented as strong and valiant, and famous for his victories in the games, he observes that every generation, even of a great and glorious family, is not equally illustrious, any more than the fields and trees are every year equally fruitful; that the gods had not given mortals any certain tokens, by which they might foreknow when the rich years of virtue should succeed; whence it comes to pass, that men out of self-conceit and presumption, are perpetually laying schemes, and forming enterprizes, without previously consulting prudence or wisdom, whose streams, says he, lie remote and out of the common road. From all which he infers, that it is

\* Vid. Pref.  
to *West's*  
*Pindar*.

better to moderate our desires, and set bounds to our  
avarice and ambition; with which moral precept he  
concludes the ode.

## S T R O P H E I.

Daughter of Rhea! thou, whose holy fire  
Before the awful feat of justice flames!  
Sister of heav'n's almighty fire!  
Sister of Juno, who co-equal claims  
With Jove to share the empire of the Gods!  
O virgin Vesta! to thy dread abodes,  
Lo! Aristagoras directs his pace!  
Receive and near thy sacred sceptre place  
Him, and his colleagues, who, with honest zeal,  
O'er Tenedos preside, and guard the public weal.

## A N T I S T R O P H E I.

And lo! with frequent off'rings, they adore  
Thee \*, first invok'd in ev'ry solemn pray'r!  
To thee unmix'd libations pour,  
And fill with od'rous fumes the fragrant air.  
Around in festive songs the hymning choir  
Mix the melodious voice and sounding lyre,  
While still, prolong'd with hospitable love,  
Are solemniz'd the rites of genial Jove:  
Then guard him, Vesta, through his long career,  
And let him close in joy his ministerial year.

## E P O D E I.

But hail, Arcesilas! all hail  
To thee, blest father of a son so great!  
Thou whom on fortune's highest scale  
The favourable hand of heav'n hath set,  
Thy manly form with beauty hath refin'd,  
And match'd that beauty with a valiant mind.  
Yet let not man too much presume,  
Tho' grac'd with beauty's fairest bloom;  
Tho' for superior strength renown'd;  
Tho' with triumphal chaplets crown'd:  
Let him remember, that, in flesh array'd,  
Soon shall he see that mortal vestment fade;  
Till lost, imprison'd in the mould'ring urn,  
To earth, the end of all things, he return.

## S T R O P H E II.

Yet should the worthy from the public tongue  
Receive their recompence of virtuous praise;  
By ev'ry zealous patriot sung,  
And deck'd with ev'ry flow'r of heav'nly lays.  
Such retribution in return for fame,  
Such, Aristagoras, thy virtues claim,  
Claim from thy country; on whose glorious brows  
The wrestler's chaplet still unfaded blows;  
Mix'd with the great Pancratiatic crown,  
Which from the neighb'ring youth thy early valour won.

## A N T I S T R O P H E II.

And (but his timid parents' cautious love,  
Disturbing ever his too forward hand,  
Forbad their tender son to prove  
The toils of Pythia\* or Olympia's sands),  
Now by the Gods I swear, his valorous might  
Had 'scap'd victorious in each bloody fight;  
And from \* Callatia, or where dark with shade  
The mount † of Saturn rears its olive head,

Great and illustrious home had he return'd;  
While, by his fame eclips'd, his vanquish'd foes had  
Mourn'd.

## E P O D E II.

Then, his triumphal tresses bound  
With the dark verdure of th' Olympie grove,  
With joyous banquets had he crown'd  
The great quinquennial festival of Jove;  
And cheer'd the solemn pomp with choral lays,  
Sweet tribute, which the muse to virtue pays.  
But, such is man's prepost'rous fate!  
Now, with o'er-weening pride elate,  
Too far he aims his shaft to throw,  
And straining bursts his feeble bow:  
Now pusillanimous depress'd with fear,  
He checks his virtue in the mid-career;  
And of his strength distrustful, coward flies  
The contest, tho' empow'r'd to gain the prize.

## S T R O P H E III.

But who could err in prophesying good  
Of him, whose undegenerating breath  
Swells with a tide of Spartan blood,  
From fire to fire in long succession trac'd  
Up to Pifander; who in days of yore  
From old Amyclæ to the Lesbian shore  
And Tenedos, collegu'd in high command  
With great Orestes, led th' Æolian band?  
Nor was his mother's race less strong and brave,  
Sprung from a stock that grew on fair † Ismenus' wave.

## A N T I S T R O P H E III.

Tho' for long intervals obscur'd, again  
Of times the seeds of lineal worth appear.  
For neither can the furrow'd plain  
Full harvests yield with each returning year;  
Nor in each period will the pregnant bloom  
Invest the smiling tree with rich perfume.  
So, barren often and inglorious pass  
The generations of a noble race;  
While nature's vigour, working at the root,  
In after-ages swells, and blossoms into fruit.

## E P O D E III.

Nor hath Jove giv'n us to foreknow  
When the rich years of virtue shall succeed:  
Yet bold and daring on we go,  
Contriving schemes of many a mighty deed;  
While hope, fond inmate of the human mind,  
And self-opinion, active, rash, and blind,  
Hold up a false illusive ray,  
That leads our dazzled feet astray  
Far from the springs, where, calm and slow,  
The secret streams of wisdom flow.  
Hence should we learn our ardour to restrain:  
And limit to due bounds the thirst of gain.  
To rage and madness oft that passion turns,  
Which with forbidden flames despairing burns.

60. From the above specimen, and from what we  
have already said on this subject, the reader will per-  
ceive, that odes of this sort are distinguished by the  
happy transitions and digressions which they admit,  
and the surprising yet natural returns to the subject.  
This requires great judgment and genius; and the

poet

\* It was  
usual in all  
solemn fac-  
rifices and  
prayers to  
begin with  
invoking  
Vesta.

† Ismenus  
was a river  
of Boeotia,  
of which  
country was  
Menasip-  
pus, the  
ancestor of  
Aristagoras  
by the  
mother's  
side.

\* A river,  
upon whose  
banks the  
Pythian  
games were  
exhibited.  
† A small  
hill planted  
with olives,  
that over-  
looked the  
Stadium at  
Olympia.

poet who would excel in this kind of writing, should draw the plan of his poem, in manner of the argument we have above inserted, and mark out the places where those elegant and beautiful fallies and wanderings may be made, and where the returns will be easy and proper.

Pindar, it is universally allowed, had a poetical and fertile imagination, a warm and enthusiastic genius, a bold and figurative expression, and a concise and sententious style: but it is generally supposed that many of those pieces which procured him such extravagant praises and extraordinary testimonies of esteem from the ancients, are lost; and if they were not, it would be perhaps impossible to convey them into our language; for beauties of this kind, like plants of an odorous and delicate nature, are not to be transplanted into another clime without losing much of their fragrance, or essential quality.

61. With regard to those compositions which are usually called *Pindaric odes*, (but which ought rather to be distinguished by the name of *irregular odes*), we have many in our language that deserve particular commendation: and the criticism Mr Congreve has given us on that subject, has too much asperity, and too great latitude; for if other writers have, by mistaking Pindar's measures, given their odes an improper title, it is a crime, one would think, not so dangerous to the commonwealth of letters, as to deserve such severe reproof. Beside which, we may suppose that some of these writers did not deviate from Pindar's method through ignorance, but by choice; and that as their odes were not to be performed with both singing and dancing, in the manner of Pindar's, it seemed unnecessary to confine the first and second stanzas to the same exact numbers as was done in his strophes and antistrophes. The poet therefore had a right to indulge himself with more liberty; and we cannot help thinking, that the ode which Mr Dryden has given us, intitled, *Alexander's Feast, or the Power of Music*, is altogether as valuable in his loose and wild numbers, as it could have been if the stanzas were more regular, and written in the manner of Pindar. In this ode there is a wonderful sublimity of thought, a loftiness and sweetness of expression, and a most pleasing variety of numbers.

'Twas at the royal feast, for Persia won

By Philip's warlike son,

Aloft, in awful state,

The god-like hero sat

On his imperial throne:

His valiant peers were plac'd around;

Their brows with roses and with myrtles bound,

(So should desert in arms be crown'd:)

The lovely Thais by his side

Sat like a blooming eastern bride,

In flow'r of youth and beauty's pride.

Happy, happy, happy pair!

None but the brave,

None but the brave,

None but the brave,

None but the brave deserve the fair.

Chor. *Happy, happy, &c.*

Timotheus, plac'd on high

Amid the tuneful quire,

With flying fingers touch'd the lyre:  
The trembling notes ascend the sky,

And heav'nly joys inspire.

The song began from Jove,  
Who left his blissful seats above,  
(Such is the pow'r of mighty love!)

A dragon's fiery form bely'd the God:  
Sublime on radiant spheres he rode,

When he to fair Olympia press'd;

And while he fought her snowy breast:

Then round her slender waist he curl'd,

And stamp'd an image of himself, a sov'reign of  
the world.

The list'ning crowd admire the lofty sound.

A present deity, they shout around;

A present deity, the vaulted roofs rebound:

With ravisht ears

The monarch hears,

Assumes the God,

Affects to nod,

And seems to shake the spheres.

Chor. *With ravisht ears, &c.*

The praise of Bacchus then the sweet musician sung;

Of Bacchus ever fair and ever young:

The jolly God in triumph comes;

Sound the trumpets, beat the drums:

Flush'd with a purple grace,

He shows his honest face:

Now give the hauboy breath; he comes, he comes!

Bacchus, ever fair and young,

Drinking joys did first ordain:

Bacchus' blessings are a treasure,

Drinking is the soldier's pleasure:

Rich the treasure,

Sweet the pleasure:

Sweet is pleasure after pain.

Chor. *Bacchus' blessings, &c.*

Sooth'd with the sound, the king grew vain,

Fought all his battles o'er again;

And thrice he routed all his foes, and thrice he  
slew the slain.

The master saw the madness rise;

His glowing cheeks, his ardent eyes;

And while he heav'n and earth defy'd,

Chang'd his hand, and check'd his pride.

He chose a mournful muse

Soft pity to infuse:

He sung Darius great and good,

By too severe a fate,

Fallen, fallen, fallen, fallen,

Fallen from his high estate,

And weltring in his blood;

Deserted at his utmost need,

By those his former bounty fed,

On the bare earth expos'd he lies,

With not a friend to close his eyes.

With down-cast looks the joyless victor sat,

Revolving in his alter'd soul

The various turns of chance below;

And now and then a sigh he stole,

And tears began to flow.

Chor. *Revolving, &c.*

The mighty master smil'd, to see

'That love was in the next degree

'Twas but a kindred found to move;

For pity melts the mind to love.

Softly sweet, in Lydian measures :

Soon he loath'd his soul to pleasures.

War, he sung, is toil and trouble ;

Honour but an empty bubble,

Never ending, still beginning,

Fighting still, and still destroying.

If the world be worth thy winning,

Think, O think, it worth enjoying.

Lovely Thais sits beside thee,

Take the good the gods provide thee.

The many rend the skies with loud applause ;

So love was crown'd, but music won the cause.

The prince, unable to conceal his pain,

Gaz'd on the fair,

Who caus'd his care,

And sigh'd and look'd, sigh'd and look'd.

Sigh'd and look'd, and sigh'd again :

At length with love and wine at once oppress'd,

The vanquish'd victor sunk upon her breast.

*Chor. The prince, &c.*

Now strike the golden lyre again ;

A louder yet, and yet a louder strain.

Break his bands of sleep asunder,

And rouse him, like a rattling peal of thunder.

Hark ! hark ! the horrid sound

Has rais'd up his head,

As awak'd from the dead,

And amaz'd he stares round.

Revenge, revenge, Timotheus cries,

See the furies arise :

See the snakes that they rear,

How they hiss in their hair,

And the sparkles that flash from their eyes ;

Behold a ghastly band,

Each a torch in his hand !

Those are Grecian, that in battle were slain,

And unbury'd remain,

Inglorious on the plain.

Give the vengeance due

To the valiant crew.

Behold how they tofs their torches on high,

How they point to the Persian abodes.

And glitt'ring temples of their hostile gods.

The princes applaud, with a furious joy ;

And the king seiz'd a flambeau, with zeal to destroy ;

Thais led the way

To light him to his prey,

And, like another Helen, fir'd another Troy.

*Chor. And the king seiz'd, &c.*

Thus long ago,

While organs yet were mute ;

Timotheus, to his breathing flute,

And sounding lyre,

Could swell the soul to rage, or kindle soft desire.

At last divine Cecilia came,

Inventress of the vocal frame ;

The sweet enthusiast, from her sacred store,

Enlarg'd the former narrow bounds,

And added length to solemn sounds,

With nature's mother-wit, and arts unknown before.

Let old Timotheus yield the prize,

Or both divide the crown ;

He rais'd a mortal to the skies ;

She drew an angel down.

*Grand chor. At last, &c.*

As Mr Pope has employ'd his masterly pen upon the same subject, it would be doing him a sort of injustice not to let him appear with Mr Dryden. Each of these odes, we may venture to say, is written with a spirit of poetry peculiar to the great genius of their respective authors ; but which of them has succeeded best, let the critics determine.

Descend, ye Nine ! descend and sing ;

The breathing instruments inspire,

Wake into voice each silent string,

And sweep the sounding lyre !

In a sadly-pleasing strain

Let the warbling lute complain :

Let the loud trumpet found,

Till the roofs all around

The shrill echoes rebound :

While, in more lengthen'd notes and slow,

The deep, majestic, solemn organs blow.

Hark ! the numbers soft and clear

Gently steal upon the ear ;

Now louder, and yet louder rise,

And fill with spreading sounds the skies :

Exulting in triumph now swell the bold notes,

In broken air, trembling, the wild music floats ;

Till, by degrees, remote and small,

The strains decay,

And melt away

In a dying, dying fall.

By music minds an equal temper know,

Nor swell too high, nor sink too low.

If in the breast tumultuous joys arise,

Music her soft assuasive voice applies ;

Or when the soul is press'd with cares,

Exalts her in enlivening airs.

Warriors she fires with animated sounds,

Pours balm into the bleeding lover's wounds :

Melancholy lifts her head,

Morpheus rouses from his bed,

Sloth unfolds her arms and wakes,

Lift'ning Envy drops her snakes ;

Intestine war no more our passions wage,

And giddy factions hear away their rage.

But when our country's cause provokes to arms,

How martial music ev'ry bosom warms !

So when the first bold vessel dar'd the seas,

High on the stern the Thracian rais'd his strain,

While Argo saw her kindred trees

Descend from Pelion to the main.

Transported Demi-gods stood round,

And men grew heroes at the sound,

Enflam'd with glory's charms :

Each chief his sevenfold shield display'd,

And half unsheath'd the shining blade ;

And seas, and rocks, and skies rebound,

To arms, to arms, to arms !

But when through all th' infernal bounds

Which flaming Phlegeton furrounds,

Love, strong as death the poet led

To the pale nations of the dead,

What sounds were heard,

What scenes appear'd

O'er all the dreary coasts !

Dreadful gleams,

Dismal screams,

Fires that glow,

Shrieks

Shrieks of wo,  
Sullen moans,  
Hollow groans,  
And cries of tortur'd ghosts!  
But hark! he strikes the golden lyre,  
And see, the tortur'd ghosts respire!  
See shady forms advance!  
Thy stone, O Sisyphus, stands still,  
Ixion rests upon his wheel,  
And the pale spectres dance!  
The Furies sink upon their iron beds,  
And snakes uncurl'd hang lightning round their heads.  
By the streams that ever flow,  
By the fragrant winds that blow—  
O'er the Elysian flow'rs;  
By those happy souls who dwell  
In yellow meads of asphodel,  
Or amaranthine bow'rs;  
By the heroes armed shades,  
Glitt'ring thro' the gloomy glades;  
By the youths who died for love,  
Wand'ring in the myrtle grove;  
Restore, restore, Eurydice to life:  
Oh take the husband, or return the wife!  
He sung, and hell consented  
To hear the poet's pray'r;  
Stern Proserpine relented,  
And gave him back the fair.  
Thus song could prevail  
O'er death and o'er hell,  
A conquest how hard and how glorious!  
Tho' fate had fast bound her  
With Styx nine times round her,  
Yet music and love were victorious.  
But soon, too soon, the lover turns his eyes:  
Again she falls, again she dies, he dies!  
How wilt thou now the fatal sisters move?  
No crime was thine, if 'tis no crime to love,  
Now under hanging mountains,  
Beside the fall of fountains,  
Or where Hebrus wanders,  
Rolling in mæanders,  
All alone  
Unheard, unknown,  
He makes his moan;  
And calls her ghost,  
For ever, ever, ever lost!  
Now with furies surrounded,  
Despairing, confounded,  
He trembles, he glows  
Amidst Rhodope's snows:  
See, wild as the winds, o'er the desert he flies!  
Hark! Hæmus resounds with the Bacchanals cries  
——— Ah see, he dies!  
Yet even in death Eurydice he sung,  
Eurydice still trembled on his tongue;  
Eurydice the woods,  
Eurydice the floods,  
Eurydice the rocks and hollow mountains rung.  
Music the fiercest grief can charm,  
And fate's severest rage disarm:  
Music can soften pain to ease,  
And make despair and madness please:  
Our joys below it can improve,  
And antedate the bliss above.

This the divine CECILIA found,  
And to her Maker's praise confin'd the found.  
When the full organ joins the tuneful quire,  
Th' immortal pow'rs incline their ear;  
Borne on the swelling notes our souls aspire,  
While solemn airs improve the sacred fire,  
And angels lean from heav'n to hear.  
Of Orpheus now no more let poets tell,  
To bright Cecilia greater pow'r is giv'n:  
His numbers rais'd a shade from hell,  
Her's lift the soul to heav'n.

The following imitation of the 9th ode of the first book of Horace, by Mr Congreve, is of the irregular kind; and has been much admir'd, as well for the beautiful description of the winter, as for his moral reflections.

Bless me, 'tis cold! how chill the air!  
How naked does the world appear!  
But see (big with the offspring of the north)  
The teaming clouds bring forth:  
A show'r of soft and fleecy rain  
Falls to new-clothe the earth again.  
Behold the mountain-tops, around,  
As if with fur of ermins crown'd:  
And lo! how by degrees  
The universal mantle hides the trees  
In hoary flakes, which downward fly,  
As if it were the autumn of the sky;  
Trembling the groves sustain the weight, and bow  
Like aged Limbs, which feebly go  
Beneath a venerable head of snow.  
Diffusive cold does the whole earth invade;  
Like a disease, thro' all its veins 'tis spread,  
And each late living stream is numb'd and dead.  
Let's melt the frozen hours, make warm the air;  
Let cheerful fires Sol's feeble beams repair:  
Fill the large bowl with sparkling wine;  
Let's drink, 'till our own faces shine,  
'Till we like suns appear,  
To light and warm the hemisphere.  
Wine can dispense to all both light and heat,  
They are with wine incorporate:  
That pow'ful juice, with which no cold dares mix,  
Which still is fluid, and no frost can fix;  
Let that but in abundance flow,  
And let it storm and thunder, hail and snow,  
'Tis heav'n's concern; and let it be  
The care of heaven still, for me.  
Those winds, which rend the oaks and plough the sea,  
Great Jove can, if he please,  
With one commanding nod appease.  
Seek not to know to-morrow's doom;  
That is not ours, which is to come.  
The present moment's all our store;  
The next should heav'n allow,  
Then this will be no more:  
So all our Life is but one instant now.  
Look on each day you've past  
To be a mighty treasure won:  
And lay each moment out in haste;  
We're sure to live too fast,  
And cannot live too soon.  
Youth does a thousand pleasures bring  
Which from decrepid age will fly;

The flowers that flourish in the spring,

In winter's cold embraces die.

Now Love, that everlasting *Boy*, invites

To revel, while you may, in soft delights.

Now the kind nymph yields all her charms,

Nor yields in vain to youthful arms:

Slowly she promises at night to meet;

But eagerly prevents the hour with swifter feet;

To gloomy groves and shades obscure she flies,

There veils the bright confession of her eyes.

Unwilling she stays,

Would more unwillingly depart,

And in soft sighs conveys

The whispers of her heart.

Still she invites, and still denies,

And vows she'll leave you if y<sup>e</sup> are rude;

Then from her ravisher she flies,

But flies to be pursu'd:

If from his sight she does herself convey,

With a feign'd laugh she will herself betray,

And cunningly instruct him in the way.

Mr Maſon's ode on *Conſtancy*, which is alſo of the irregular kind, ſhows that theſe ſort of odes are well adapted to ſubjects of an elevated and ſublime nature, where much imagery is introduced.

Whence does this ſudden luſtre riſe,

That gilds the grove? Not like the noon-tide beam

Which ſparkling dances on the trembling ſtream,

Nor the blue lightning's ſaſh ſwiſt-ſhooting thro' the

But ſuch a ſolemn ſteady light, [ſkies;

As o'er the cloudleſs azure ſteals,

When CYNTHIA, riding on the brow of night,

Stops in their mid career her ſilver wheels.

Whence can it riſe, but from the ſober pow'r

Of CONſTANCY? ſhe, heaven-born queen,

Deſcends, and in this (A) woobine-veſted bower

Fixes her ſtedfaſt reign:

Stedfaſt as when her high command

Gives to the ſtarry band

Their radiant ſtatons in heav'n's ample plain:

Stedfaſt, as when around this æther ſphere

She winds the purple year:

Tells what time the ſnow-drop cold

Its maiden whitenefs may unfold,

When the golden harveſt bend;

Then bids pale Winter wake to pour

The pearly hail's tranſlucent ſhower,

When the ruddy fruits deſcend,

To caſt his ſilv'ry mantle o'er the woods,

And bind in cryſtal chains the ſlumb'ring floods;

The ſoul, which ſhe inſpires, has pow'r to climb

To all the heights ſublime

Of virtue's tow'ring hill.

That hill, at whoſe low foot weak warbling ſtrays

The ſcanty ſtream of human praiſe,

A ſhallow trickling rill.

While on the ſummits how'ring angels ſhed

From their bleſt pinions the nectarian dews

Of rich immortal fame: from theſe the muſe

Oft ſteals ſome precious drops, and blends with art

With thoſe the lower ſtreams impart;

Then ſhow'rs it all on ſome high-favour'd head.

But thou, ELFRIDA, claim'ſt the genuine dew;

Thy worth demands it all,

Pure and unmixt on theſe the ſacred drops ſhall fall.

We ſhall conclude this ſection, and theſe examples, with Dr Akenſide's ode on the ſubject we have been treating of. In this piece, which is an original of the kind, the meaſures are varied in imitation of thoſe ancients who have excelled in *lyric poetry*.

Once more I join the Theſpian quire,

And taſte th' inſpiring ſount again;

O parent of the Grecian lyre,

Admit me to thy ſacred ſtrain—

And lo! with eaſe my ſtep invades

The pathleſs vale and opening ſhades,

'Till now I ſpy her verdant feat;

And now at large I drink the ſound,

While theſe her offspring, liſt'ning round,

By turns her melody repeat.

I ſee Anacreon ſmile and ſing,

His ſilver treſſes breathe perfume;

His cheek diſplays a ſecond ſpring

Of roſes, taught by wine to bloom.

Away, deceitful cares, away!

And let me liſten to his lay,

While flow'ry dreams my ſoul employ;

While turtle-wing'd the laughing Hours,

Lead hand in hand the feſtal pow'rs,

Lead Youth and Love, and harmleſs Joy.

Broke from the fetters of his native land,

Devoting ſhame and vengeance to her lords,

With louder impuſe, and a threat'ning hand,

The Leſbian (B) patriot ſmites the ſounding

Ye wretches, ye perſidious train, (chords:

Ye curſ of gods and free-born men,

Ye murderers of the laws,

Though now you glory in your luſt,

Though now you tread the feeble neck in duſt,

Yet time and righteous *Justice* will judge your dreadful

cauſe.

But lo, to Sappho's mournful airs

Deſcends the radiant queen of love;

She ſmiles, and aſks what ſonder cares

Her ſuppliant's plaintive meaſures move:

Why is my faithful maid diſtreſt?

Who, Sappho, wounds thy tender breaſt?

Say, ſies he?—ſoon he ſhall purſue:

Shuns he thy gifts?—he too ſhall give:

Slights he thy ſorrows?—he ſhall grieve,

And bend him to thy haughty vow.

But, O Melpomene, for whom

Awakes thy golden ſhell again?

What mortal breath ſhall e'er preſume

To echo that unbounded ſtrain?

Majeſtic in the frown of years,

Behold the man † of Thebes appears:

For ſome there are, whoſe mighty frame

To

† Pindar.

(A) In which Ethelwold and Elfrida had been juſt exchanging profeſſions of their mutual fidelity.

(B) Alceus of Mitylene, the capital of Leſbos, who fled from his native city to eſcape the operation of thoſe who had ſlaved it, and wrote againſt them in his exile thoſe noble invectives which are much applauded by the ancient critics.

The hand of Jove at birth endow'd  
With hopes that mock the gazing crowd;  
As eagles drink the noontide flame,  
While the dim raven beats his weary wings,  
And clamours far below.—Propitious muse,  
While I so late unlock thy hallow'd springs,  
And breathe whatever thy ancient airs infuse,  
To polish Albion's warlike car  
This long-lost melody to hear,  
Thy sweetest arts employ;

As when the winds from shore to shore,  
Thro' Greece thy lyre's persuasive language bore,  
Till towns, and isles, and seas return'd the vocal joy.  
But oft amid the Græcian throng,  
The loose-rob'd forms of wild desire  
With lawless notes intun'd thy song,  
To shameful steps dissolv'd thy quire.  
O fair, O chaste, be still with me,  
From such profaner discord free:

While I frequent thy tuneful shade,  
No frantic shouts of Thracian dames,  
No satyrs fierce with savage flames,  
Thy pleasing accents shall invade.

Queen of the lyre, in thy retreat,  
The fairest flow'rs of Pindus glow;  
The vine aspires to crown thy seat,  
And myrtles round thy laurel grow.  
Thy strings attune their varied strain,  
To every pleasure, every pain,

Which mortal tribes were born to prove;  
And strait our passions rise or fall,  
As, at the winds imperious call,

The ocean swells, the billows move.  
When midnight listens o'er the slumbering earth,  
Let me, O muse, thy solemn whispers hear:  
When morning sends her fragrant breezes forth,  
With airy murmurs touch my opening ear.

And ever watchful at thy side,  
Let wisdom's awful suffrage guide

The tenor of thy lay:

To her of old by Jove was giv'n  
To judge the various deeds of earth and heav'n;

'Twas thine by gentle arts to win us to her sway.

Oft as from stricter hours resign'd,

I quit the maze where science toils,

Do thou refresh my yielding mind

With all thy gay, delusive spoils.

But, O indulgent, come not nigh

The busy steps, the jealous eye,

Of gainful Care and wealthy Age,

Whose barren souls thy joys disdain,

And hold as foes to reason's reign

Whome'er thy lovely haunts engage.

With me, when Mirth's consenting band,

Around fair Friendship's genial board,

Invite the heart-awakening hand,

With me salute the Teian chord.

Or if involk'd at foster hours,

O seek with me the happy bow'rs

That hear Dione's gentle tongue;

To beauty link'd with virtue's train,

To love devoid of jealous pain,

There let the sapphic lute be strung.

But when from envy, and from death, to claim

A hero bleeding for his native land;

Or, when to nourish freedom's vestal flame,

I hear my genius utter his command;

Nor Theban voice, nor Lesbian lyre

From thee, O muse, do I require,

While my prophetic mind,

Conscious of pow'r's the never knew,

Astonish'd, grasps at things beyond her view,

Nor by another's fate hath felt herself confin'd.

### SECT. III. Of the Elegy.

62. THE *Elegy* is a *mournful and plaintive*, but yet sweet and engaging kind of poem. It was first invented to bewail the death of a friend; and afterwards used to express the complaints of lovers, or any other melancholy subject. In process of time, not only matters of grief, but joy, wishes, prayers, expostulations, reproaches, admonitions, and almost every other subject, were admitted into elegy; however, funeral lamentations and affairs of love seem most agreeable to its character.

The plaintive elegy, in mournful state,  
Dishevell'd weeps the stern decrees of fate;  
Now paints the lover's torments and delights;  
Now the nymph flatters, threatens, or invites.  
But he, who would these passions well express,  
Must more of love than poetry possess.  
I hate those lifeless writers whose forc'd fire  
In a cold style describes a hot desire;  
Who sigh by rule, and, raging in cold blood,  
Their sluggish muse spur to an am'rous mood.  
Their ecstasies insipidly they feign;  
And always pinc, and fondly hug their chain;  
Adore their prison, and their sufferings bless;  
Make sense and reason quarrel as they please.  
'Twas not of old in this affected tone,  
That smooth Tibullus made his am'rous moan;  
Or tender Ovid, in melodious strains,  
Of love's dear art the pleasing rules explains.  
You, who in elegy would justly write,  
Consult your heart; let that alone endite.

[From the French of Despreux.] SOAMES.

The plan of an elegy, as indeed of all other poems, ought to be made before a line is written; or else the author will ramble in the dark, and his verses have no dependance on each other. No *epigrammatic points* or conceits, none of those *fine things* which most people are so fond of in every sort of poem, can be allowed in this, but must give place to nobler beauties, those of *nature* and the *passions*. Elegy rejects whatever is facetious, satirical, or majestic, and is content to be plain, decent, and unaffected; yet in this humble state is the sweet and engaging, elegant and attractive. This poem is adorned with frequent *commiserations*, *complaints*, *exclamations*, *addresses to things or persons*, short and proper *digressions*, *allusions*, *comparisons*, *proposals* or feigned persons, and sometimes with short descriptions. The diction ought to be free from any harshness; neat, easy, perspicuous, expressive of the *manners*, *tender*, and *pathetic*; and the numbers should be smooth and flowing, and captivate the ear with their uniform sweetness and delicacy.

Of elegies on the subject of death, that by Mr Gray, written in a country church-yard, is one of the best that has appeared in our language, and may be justly esteemed

esteemed a masterpiece. But being so generally known, it would be superfluous to insert it here.

On the subject of love, we shall give an example from the elegies lately published by Mr Hammond.

Let others boast their heaps of shining gold,  
And view their fields with waving plenty crown'd,  
Whom neighb'ring foes in constant terror hold,  
And trumpets break their slumbers, never found:  
While, calmly poor, I trifle life away,  
Enjoy sweet leisure by my cheerful fire,  
No wanton hope my quiet shall betray,  
But cheaply blest I'll scorn each vain desire.  
With timely care I'll sow my little field,  
And plant my orchard with its master's hand;  
Nor blush to spread the hay, the hook to wield,  
Or range the sheaves along the sunny land.

If late at dusk, while carelessly I roam,  
I meet a strolling kid or bleating lamb,  
Under my arm I'll bring the wand'ring home,  
And not a little chide its thoughtless dam.  
What joy to hear the tempest howl in vain,  
And clasp a fearful mistress to my breast?  
Or lull'd to slumber by the beating rain,  
Secure and happy sink at last to rest.  
Or if the sun in flaming Leo ride,

By shady rivers indolently stray,  
And, with my DELIA walking side by side,  
Hear how they murmur, as they glide away.  
What joy to wind along the cool retreat,  
To stop and gaze on DELIA as I go!  
To mingle sweet discourse with kisses sweet,  
And teach my lovely scholar all I know!  
Thus pleas'd at heart, and not with fancy's dream,  
In silent happiness I rest unknown;  
Content with what I am, not what I seem,  
I live for DELIA and myself alone.

Ah foolish man! who, thus of her possess'd,  
Could float and wander with ambition's wind,  
And, if his outward trappings spoke him blest,  
Not heed the sickness of his conscious mind.  
With her I scorn the idle breath of praise,  
Nor trust to happiness that's not our own;  
The smile of fortune might suspicion raise,  
But here I know that I am lov'd alone.

STANHOPE, in wisdom as in wit divine,  
May rise and plead Britannia's glorious cause,  
With steady reign his eager wit confine,  
While manly sense the deep attention draws.  
Let STANHOPE speak his list'ning country's wrongs,  
My humble voice shall please one partial maid;  
For her alone I pen the tender song,  
Securely sitting in his friendly shade.

STANHOPE shall come, and grace his rural friend;  
DELIA shall wonder at her noble guest,  
With blushing awe the ripper fruit commend,  
And for her husband's patron cull the best.  
Her's be the care of all my little train,

While I with tender indulgence am blest,  
The favourite subject of her gentle reign,  
By love alone distinguish'd from the rest.  
For her I'll yoke my oxen to the plough,  
In gloomy forests tend my lonely flock,  
For her a goat-herd climb the mountain's brow,  
And sleep extended on the naked rock.  
Ah! what avails to press the flately bed,

And far from her 'midst tasteless grandeur weep,  
By warbling fountains lay the pensive head,  
And, while they murmur, strive in vain to sleep!  
DELIA alone can please and never tire,  
Exceed the paint of thought in true delight;  
With her, enjoyment wakens new desire,  
And equal rapture glows thro' every night.  
Beauty and worth, alone in her, contend,  
To charm the fancy, and to fix the mind;  
In her, my wife, my mistress, and my friend,  
I taste the joys of sense and reason join'd.  
On her I'll gaze when others loves are o'er,  
And dying press her with my clay-cold hand——  
Thou weep'st already, as I were no more,  
Nor can that gentle breast the thought withstand,  
Oh! when I die, my latest moments spare,  
Nor let thy grief with sharper torments kill:  
Would not thy cheeks, nor hurt that flowing hair;  
Tho' I am dead, my soul shall love thee still.  
Oh quit the room, oh quit the deathful bed,  
Or thou wilt die, so tender is thy heart!  
Oh leave me, DELIA! ere thou see me dead,  
These weeping friends will do thy mournful part.  
Let them, extended on the decent bier,  
Convey the corpse in melancholy state,  
Thro' all the village spread the tender tear,  
While pitying maids our wond'rous loves relate.

#### SECT. IV. *Of the Pastoral.*

63. This poem takes its name from the Latin word *pastor*, a "shepherd;" the subject of it being something in the pastoral or rural life; and the persons, or interlocutors, introduced in it, either shepherds or other rustics.

These poems are frequently called *eclogues*, which signifies "select or choice pieces;" though some account for this name in a different manner. They are also called *busidicks*, from *BUSSOLE*, a "herdsman."

This kind of poem, when happily executed, gives great delight; nor is it a wonder, since innocence and simplicity generally please: to which let us add, that the scenes of pastorals are generally laid in the country, where both poet and painter have abundant matter for the exercise of genius, such as enchanting prospects, purling streams, shady groves, enamelled meads, flowery lawns, rural amusements, the bleating of flocks, and the music of birds; which is of all melody the most sweet and pleasing, and calls to our mind the wisdom and taste of Alexander, who, on being importuned to hear a man that imitated the notes of the nightingale, and was thought a great curiosity, replied, that he had had the happiness of hearing the nightingale herself.

The character of the pastoral consists in simplicity, brevity, and delicacy; the two first render an eclogue *natural*, and the last *delightful*. With respect to nature, indeed, we are to consider, that as a pastoral is an image of the ancient times of innocence and undesigning plainness, we are not to describe shepherds as they really are at this day, but as they may be conceived then to have been, when the best of men, and even princes, followed the employment. For this reason, an air of piety should run through the whole poem; which is visible in the writings of antiquity.

To make it natural with respect to the present age, some

*Pastoral.* some knowledge in rural affairs should be discovered, and that in such a manner as if it was done by chance rather than by design; left by too much pains to seem natural, that simplicity be destroyed from, whence arises the delight; for what is so engaging in this kind of poetry proceeds not so much from the idea of a country life itself, as in exposing only the best part of a shepherd's life, and concealing the misfortunes and miseries which sometimes attend it. Besides, the subject must contain some particular beauty in itself, and each eclogue present a scene or prospect to our view enriched with variety: which variety is in a great measure obtained by frequent comparisons drawn from the most agreeable objects of the country; by interrogations to things inanimate; by short and beautiful digressions; and by elegant turns on the words, which render the numbers more sweet and pleasing. To this let us add, that the connections must be negligent, the narrations and descriptions short, and the periods concise.

Riddles, parables, proverbs, antique phrases, and superstitious fables, are fit materials to be intermixed with this kind of poem. They are here, when properly applied, very ornamental; and the more so, as they give our modern compositions the air of the ancient manner of writing.

The style of the pastoral ought to be humble, yet pure; neat, but not florid; easy, and yet lively: and the numbers should be smooth and flowing.

This poem in general should be short, and ought never much to exceed 100 lines; for we are to consider that the ancients made these sort of compositions their amusement, and not their business: but however short they are, every eclogue must contain a plot or fable, which must be simple and one; but yet so managed as to admit of short digressions. Virgil has always observed this—We shall give the plot or argument of his first pastoral as an example. *Melibœus, an unfortunate shepherd, is introduced with Tityrus, one in more fortunate circumstances; the former addresses the complaint of his sufferings, and banishment to the latter, who enjoys his flock and folds in the midst of the public calamity, and therefore expresses his gratitude to the benefactor from whom this favour flowed: but Melibœus accuses fortune, civil wars, and bids adieu to his native country. This is therefore a dialogue.*

But we are to observe, that the poet is not always obliged to make his eclogue *allegorical*, and to have real persons represented by the fictitious characters introduced; but is in this respect entirely at his own liberty.

Nor does the nature of the poem require it to be always carried on by way of dialogue; for a shepherd may with propriety sing the praises of his love, complain of her inconstancy, lament her absence, her death, &c. and address himself to groves, hills, rivers, and such like rural objects, even when alone.

We shall now give an example from each of those authors who have eminently distinguished themselves by this manner of writing, and introduce them in the order of time in which they were written.

64. Theocritus, who was the father or inventor of this kind of poetry, has been deservedly esteemed by the best critics; and by some, whose judgment we can-

not dispute, preferred to all other pastoral writers. We shall insert his third *idyllium*, not because it is the best, but because it is within our compass.

To Amaryllis, lovely nymph, I speed,  
Mean while my goats upon the mountains feed:  
O Tityrus, tend them with assiduous care,  
Lead them to crystal fountains and pastures fair,  
And of the ridgling's butting horns beware.  
Sweet Amaryllis, have you then forgot,  
Our secret pleasures in the conscious grott,  
Where in my folding arms you lay reclind?  
Blest was the shepherd, for the nymph was kind.  
I whom you call'd *your Dear*, *your Love*, so late,  
Say, am I now the object of your hate?  
Say, is my form displeasing to your sight?  
This cruel love will surely kill me quite.  
Lo! ten large apples, tempting to the view,  
Pluck'd from your favourite tree, where late they grew.  
Accept this boon, 'tis all my present store;  
To-morrow will produce as many more.  
Mean while these heart-consuming pains remove,  
And give me gentle pity for my love.  
Oh was I made by some transforming power  
A bee to buzz in your sequester'd bow'r!  
To pierce your ivy shade with murmuring sound,  
And the light leaves that compass you around.  
I know thee, Love, and to my sorrow find,  
A god thou art, but of the savage kind;  
A lioness sure suckled the fell child,  
And with his brothers nurs'd him in the wild;  
On me his scorching flames incessant prey,  
Glow in my bones, and melt my soul away.  
Ah, nymph, whose eyes destructive glances dart,  
Fair is your face, but flinty is your heart:  
With kisses kind this rage of love appease;  
For me, fond swain! ev'n empty kisses please.  
Your scorn distracts me, and will make me tear  
The flow'ry crown I wove for you to wear,  
Where roses mingle with the ivy-wreath,  
And fragrant herbs ambrosial odours breathe.  
Ah me! what pangs I feel; and yet the fair  
Nor fees my sorrows, nor will hear my pray'r.  
I'll doff my garments, since I needs must die,  
And from yon rock, that points its summit high,  
Where patient Alps snare the senny fry,  
I'll leap, and, though perchance I rise again,  
You'll laugh to see me plunging in the main.  
By a prophetic poppy-leaf I found  
Your chang'd affection, for it gave no sound  
Though in my hand struck hollow as it lay,  
But quickly wither'd like your love away.  
An old witch brought sad tidings to my ears,  
She who tells fortunes with the sieve and sheers;  
For leasing barley in my fields of late,  
She told me, I should love, and you should hate!  
For you my care a milk-white goat supply'd,  
Two wanton kids run frisking at her side;  
Which oft the nut brown maid, Erithacis,  
Has begg'd, and paid before-hand with a kiss;  
And since you thus my ardent passion slight,  
Her's they shall be before to-morrow night.  
My right eye itches; may it lucky prove,  
Perhaps I soon shall see the nymph I love;

Beneath yon pine I'll sing distinct and clear,  
Perhaps the fair my tender notes shall hear;  
Perhaps may pity my melodious moan;  
She is not metamorphos'd into loane.

Hippomenes, provok'd by noble strife,  
To win a mistress, or to lose his life,  
Threw golden fruit in Atalanta's way:  
The bright temptation caus'd the nymph to stay;  
She look'd, she languish'd, all her soul took fire,  
She plung'd into the gulph of deep desire,

To Pyle from Othrys sage Melampus came,  
He drove the loving herd, yet won the dame;  
Fair Pero blest his brother Bias' arms,  
And in a virtuous race diffus'd unfading charms.

Adonis fed his cattle on the plain,  
And sea-born Venus lov'd the rural swain;  
She mourn'd him wounded in the fatal chace,  
Nor dead dismiss'd him from her warm embrace.  
Though young Endymion was by Cynthia blest,  
I envy nothing but his lasting rest.

Jasion slumb'ring on the Cretan plain  
Ceres once saw, and blest the happy swain  
With pleasures too divine for ears profane.

My head grows giddy, love affects me fore;  
Yet you regard not; so I'll sing no more—  
Here will I put a period to my care—  
Adieu, false nymph, adieu, ungrateful fair:  
Stretch'd near the grotto, when I've breath'd my last,  
My corse will give the wolves a rich repast,  
As sweet to them as honey to your taste.

FAWKES.

65. Virgil succeeds Theocritus, from whom he has  
in some places copied, and always imitated with success.  
As a specimen of his manner, we shall introduce his first  
pastoral, which is generally allowed to be the most per-  
fect.

#### MELIBOEUS and TITYRUS.

Mel. Beneath the shade which beechen boughs diffuse,  
You, Tityrus, entertain your sylvan muse.  
Round the wide world in banishment we roam,  
Forc'd from our pleasing fields and native home;  
While stretch'd at ease you sing your happy loves,  
And Amaryllis fills the shady groves.

Tit. These blessings, friend, a deity bestow'd;  
For never can I deem him less than god.  
The tender sucklings of my woolly breed  
Shall on his holy altar often bleed.

He gave me kine to graze the flow'ry plain,  
And so my pipe renew'd the rural strain.

Mel. I envy not your fortune; but admire,  
That while the raging sword and wasteful fire  
Destroy the wretched neighbourhood around,  
No hostile arms approach your happy ground.  
Far different is my fate; my feeble goats  
With pains I drive from their forsaken cotes:  
And this you see I scarcely drag along,  
Who yearning on the rocks has left her young,  
The hope and promise of my falling fold,  
My loss by dire portents the gods foretold;  
For, had I not been blind, I might have seen  
Yon riven oak, the fairest on the green,  
And the hoarse raven on the blasted bough  
By croaking from the left presag'd the coming blow.

But tell me, Tityrus, what heav'nly pow'r  
Preserv'd your fortunes in that fatal hour?

Tit. Fool that I was, I thought imperial Rome  
Like Mantua, where on market-days we come,  
And thither drive our tender lambs from home.  
So kids and whelps their fires and dams express;  
And so the great I measur'd by the less:  
But country-towns, compar'd with her, appear  
Like shrubs among lofty cypresses are near.

Mel. What great occasion call'd you hence to Rome?

Tit. Freedom, which came at length, tho' slow to come:  
Nor did my search of liberty begin  
Till my black hairs were chang'd upon my chin.  
Nor Amaryllis would vouchsafe a look,  
Till Galatea's meaner bonds I broke.  
Till then a helpless, hopeless, homely swain,  
I fought not freedom, nor aspir'd to gain:  
Tho' many a victim from my fold was bought,  
And many a cheese to country markets brought,  
Yet all the little that I got I spent,  
And still return'd as empty as I went.

Mel. We stood amaz'd to see your mistress mourn,  
Unknowing that the pin'd for your return;  
We wonder'd why she kept her fruit so long,  
For whom so late th' ungather'd apples hung:  
But now the wonder ceases, since I see  
She kept them only, Tityrus, for thee:  
For thee the bubbling springs appear'd to mourn,  
And whisp'ring pines made vows for thy return.

Tit. What should I do? while here I was enchain'd,  
No glimpse of godlike liberty remain'd;  
Nor could I hope in any place but there  
To find a god to present to my pray'r.  
There first the youth of heav'nly birth I view'd,  
For whom our monthly victims are renew'd.  
He heard my vows, and graciously decreed  
My grounds to be restor'd, my former flocks to feed.

Mel. O fortunate old man! whose farm remains  
For you sufficient, and requites your pains,  
Though rushes overspread the neighb'ring plains,  
Tho' here the marshy grounds approach your fields  
And there the soil a stony harvest yields.  
Your teeming ewes shall no strange meadows try,  
Nor fear a rot from tainted company.  
Behold yon bord'ring fence of fallow trees [bees:  
Is fraught with flow'rs, the flow'rs are fraught with  
The busy bees, with a soft murmur strain,  
Invite to gentle sleep the lab'ring swain:  
While from the neighb'ring rock with rural songs  
The pruner's voice the pleasing dream prolongs;  
Stock-doves and turtles tell their am'rous pain,  
And, from the lofty elms, of love complain.

Tit. Th' inhabitants of seas and skies shall change,  
And fish on shore and fags in air shall range,  
The banish'd Parthian dwell on Arar's brink,  
And the blue German shall the Tigris drink;  
Ere I, forsaking gratitude and truth,  
Forget the figure of that godlike youth.

Mel. But we must beg our bread in climes unknown,  
Beneath the scorching or the freezing zone;  
And some to fair Oasis shall be fold,  
Or try the Libyan heat, or Scythian cold;  
The rest among the Britons be confin'd,  
A race of men from all the world disjoin'd.

O!

Pastoral. O! must the wretched exiles ever mourn?  
Nor after length of rolling years return?  
Are we condemn'd by fate's unjust decree,  
No more our houses and our homes to see?  
Or shall we mount again the rural throne,  
And rule the country, kingdoms once our own?  
Did we for these barbarians plant and sow,  
On these, on these, our happy fields bestow?  
Good heav'n, what dire effects from civil discord flow!  
Now let me graft my pears, and prune the vine;  
The fruit is theirs, the labour only mine.  
Farewel my pastures, my paternal flock,  
My fruitful fields, and my more fruitful flock!  
No more, my goats, shall I behold you climb  
The steepy cliffs, or crop the flow'ry thyme;  
No more extended in the grot below,  
Shall see you browsing on the mountain's brow  
The prickly shrubs, and after on the bare  
Lean down the deep abyss and hang in air!  
No more my sheep shall tip the morning dew;  
No more my song shall please the rural crew:  
Adieu, my tuneful pipe! and all the world, adieu!

*Ti.* This night, at least, with me forget your care;  
Chefnuts and curds and cream shall be your fare:  
The carpet-ground shall be with leaves o'er-spread,  
And boughs shall weave a covering for your head:  
For see you sunny hill the shade extends,  
And curling smoke from cottages ascends.

DRYDEN.

66. Spenser was the first of our countrymen, who acquired any considerable reputation by this method of writing. We shall insert his sixth eclogue, or that for June, which is allegorical, as will be seen by the

ARGUMENT. "Hobbinol, from a description of the pleasures of the place, excites Colin to the enjoyment of them. Colin declares himself incapable of delight, by reason of his ill success in love, and his loss of Rosalind, who had treacherously forsaken him for Menalcas, another shepherd. By Tityrus (mentioned before in Spenser's second eclogue, and again in the twelfth) is plainly meant Chaucer, whom the author sometimes professed to imitate. In the person of Colin, is represented the author himself; and Hobbinol's inviting him to leave the hill country, seems to allude to his leaving the North, where, as is mentioned in his life, he had for some time resided."

*Hob.* Lo! Colin, here the place, whose pleasant sight  
From other shades hath wean'd my wand'ring mind:  
Tell me, what wants me here, to work delight?  
The simple air, the gentle warbling wind,  
So calm, so cool, as nowhere else I find:  
The grassy ground with dainty daisies dight,  
The bramble-bush, where birds of every kind  
To th' water's fall their tunes attempt right.

*Col.* O! happy Hobbinol, I bless thy state,  
That paradise hast found which Adam lost.

Here wander may thy flock early or late,  
Withouten dread of wolves to been yotit;

Thy lovely lays here may'st thou freely boast?

But I, unhappy man! whom cruel fate,  
And angry Gods, pursue from coast to coast,  
Can nowhere find to shroud my luckless pate.

*Hob.* Then if by me thou list advised be,

Forsake the foil that so doth thee bewitch:

Leave me those hills, where harb'roughnis to see,

Nor holly-bush, nor brere, nor winding ditch;

And to the dales resort, where shepherds rich,

And fruitful flocks beven every where to see;

Here no night-ravens lodge, more black than pitch,  
Nor elvish ghouls, nor ghastly owls do flee.

But friendly fairies met with many graces,

And light-foot nymphs can chase the ling'ring night,

With heydeguiques, and trimly trodden tracers;

Whilst sisters nine, which dwell on Parnass' height,

Do make them music, for their more delight;

And Pan himself to kifs their crystal faces,

Will pipe and dance, when Phœbe shineth bright:

Such peerless pleasures have we in these places.

*Col.* And I, whilst youth, and course of careless years,

Did let me walk withouten links of love,

In such delights did joy amongst my peers:

But riper age such pleasures doth reprove,

My fancy eke from former follies move

To strayed steps: for time in passing wears

(As garments doen, which waxen old above)

And draweth new delights with hoary hairs.

Though couth I sing of love, and tune my pipe

Unto my plaintive pleas in verses made:

Though would I seek for queen-apples unripe

To give my Rosalind, and in fomer shade

Dight gawdy girlonds was my common trade,

To crown her golden locks: but years more ripe,

And loss of her, whose love as life I wayde,

Those weary wanton toys away did wipe.

*Hob.* Colin, to hear thy rhymes and roundels,

Which thou wert wont on wasteful hills to sing,

I more delight, than lark in summer days:

Which echo made the neighbour groves to ring,

And taught the birds, which in the lower spring

Did shroud in shady leaves from sunny rays,

Frame to thy song their cheerful chirping,

Or hold their peace, for shame of thy sweet lays.

I saw Calliope with muses moe,

Soon as thy oaten pipe began to found,

Their ivory lutes and tambourins forego,

And from the fountain, where they fate around,

Ren after hastily thy silver sound.

But when they came, where thou thy skill didst show,

They drew aback, as half with shame confound,

Shepherd to see, them in their art out-go.

*Col.* Of muses, Hobbinol, I con no skill,

For they been daughters of the highest Jove,

And holden scorn of homely shepherds quill:

For sith I heard that Pan with Phœbus strove

Which him to much rebuke and danger drove,

I never list presume to Parnass' hill,

But piping low, in shade of lowly grove,

I play to please myself, albeit ill.

Nought weigh I, who my song doth praise or blame,

Ne strive to win renown, or pass the rest:

With shepherds sits not follow flying fame,

But feed his flocks in fields, where falls him best.

I wot my rimes been rough, and rudely drest;

The fitter they, my careful care to frame:

Enough is me to paint out my unrest,

And pour my piteous complaints out in the same.

The God of shepherds, Tityrus, is dead,

Who taught me homely, as I can, to make:

He, whilst he lived, was the sovereign head  
Of shepherds all, that been with love ytake.  
Well coult he wail his woes, and lightly flake  
The flames which love within his heart had bred,  
And tell us merry tales, to keep us wake,  
The while our sheep about us safely fed.  
Now dead he is, and lieth wrapt in lead,  
(O why should death on him such outrage show!)  
And all his passing skill with him is fled,  
The fame whereof doth daily greater grow.  
But if on me some little drops would flow  
Of that the spring was in his learned hed,

I soon would learn these woods to wail my woe,  
And teach the trees their trickling tears to shed.  
Then should my plaints, caus'd of discourteese,  
As messengers of this my painful flight,  
Fly to my love, wherever that she be,  
And pierce her heart with point of worthy wight;  
As the deserves, that wrought so deadly sight.  
And thou, Menalcas, that by treachery  
Didst underfong my lads to wax so light,  
Shouldst it well be known for such thy villany.

But since I am not, as I wish I were,  
Ye gentle shepherds, which your flocks do feed,  
Whether on hills or dales, or other where,  
Bear witness all of this so wicked deed:  
And tell the lads, whose flower is woxe a weed,  
And faultless faith is turn'd to faithless seere,  
That she the truest shepherd's heart made bleed,  
That lives on earth, and loved her most dear.

*Hob.* O! careful Colin, I lament thy case,  
Thy tears would make the hardest flint to flow!  
Ah! faithless Rosalind, and void of grace,  
That art the root of all this rueful woe!

But now is time, I guess, homeward to go;  
Then rise, ye blessed flocks, and home apace,  
Lest night with stealing steps do you foreclose,  
And wet your tender lambs that by you trace.

67. By the following eclogue the reader will perceive that Mr Phillips has, in imitation of Spencer, preserved in his pastorals many antiquated words, which, though they are discarded from polite conversation, may naturally be supposed still to have place among the shepherds and other rusticks in the country. We have made choice of his second eclogue, because it is brought home to his own business, and contains a complaint against those who had spoken ill of him and his writings.

#### THENOT, COLINET.

*Th.* Is it not Colinet I lonesome see  
Leaning with folded arms against the tree?  
Or is it age of late bedims my sight?  
'Tis Colinet, indeed, in woful plight.  
Thy cloudy look, why melting into tears,  
Unfleckly, now the sky so bright appears?  
Why in this mournful manner art thou found,  
Unthankful lad, when all things smile around?  
Or hear'st not lark and linnet jointly sing,  
Their notes blithe-warbling to salute the spring?

*Co.* Tho' blithe their notes, not so my wayward fate;  
Nor lark would sing, nor linnet, in my state.  
Each creature, Thenot, to his task is born;  
As they to mirth and music, I to mourn.

Waking, at midnight, I my woes renew,  
My tears oft mingling with the falling dew.

*Th.* Small cause, I ween, has lully youth to plain;  
Or who may then the weight of eld sustain,  
When every slackening nerve begins to fail,  
And the load presseth as our days prevail?  
Yet, though with years my body downward tend,  
As trees beneath their fruit in autumn bend,  
Spite of my snowy head and icy veins,  
My mind a cheerful temper still retains:  
And why should man, mishap what will, repine,  
Sour every sweet, and mix with tears his wine?  
But tell me then; it may relieve thy woe,  
To let a friend thine inward ailment know.

*Co.* Idly 'twill waste thee, Thenot, the whole day,  
Shouldst thou give ear to all my grief can say.  
Thine ewes will wander; and the heedless lambs,  
In loud complaints, require their absent dams.

*Th.* See Lightfoot; he shall tend them closer; and I,  
Threen whiles, a-crois the plain will glance mine eye.

*Co.* Where to begin I know not, where to end.  
Does there one smiling hour my youth attend?  
Though few my days, as well my follies show,  
Yet are those days all clouded o'er with woe:  
No happy gleam of sunshine doth appear,  
My low'ring sky and wintry months to cheer.  
My piteous plight in yonder-naked tree,  
Which bears the thunder-scar, too plain I see:  
Quite destitute it stands of shelter kind,  
The mark of storms, and sport of every wind:  
The riven trunk feels not th' approach of spring;  
Nor birds among the leafless branches sing:  
No more, beneath thy shade, shall shepherds throng:  
With jocund tale, or pipe, or pleasing song.  
Ill-fated tree! and more ill-fated I!  
From thee, from me, alike the shepherds fly.

*Th.* Sure thou in hapless hour of time wast born,  
When blighting mildews spoil the rising corn,  
Or blasting winds o'er blossom'd hedge-rows pass,  
To kill the promis'd fruits, and scorch the grass;  
Or when the moon, by wizard charm'd, forethows,  
Blood-stain'd in foul eclipse, impending woes.  
Untimely born, ill luck betides thee still.

*Co.* And can there, Thenot, be a greater ill?  
*Th.* Nor fox, nor wolf, nor rot among our sheep:  
From these good shepherd's care his flock may keep:  
Against ill-luck, alas! all forecast fails;  
Nor toil by day, nor watch by night, avails.

*Co.* Ah me, the while! ah me, the luckless day!  
Ah luckless lad! bests me more to say.  
Unhappy hour! when fresh in youthful bud,  
I left, Sabrina fair, thy silv'ry flood.  
Ah, silly I! more silly than my sheep,  
Which on thy flow'ry banks I wont to keep.  
Sweet are thy banks; oh, when shall I once more,  
With ravis'd eyes review thine amell'd shore?  
When, in the crystal of thy waters, scan  
Each feature faded, and my colour wan?  
When shall I fee my hut, the small abode  
Myself did raise and cover o'er with sod?  
Small though it be, a mean and humble cell,  
Yet is there room for peace, and me, to dwell.

*Th.* And what enticement charm'd thee, far away,  
From thy lov'd home, and led thy heart astray?

*Co.*

Pastoral.

Co. A lewd desire strange lands, and swains, to know.

Ah me! that ever I should covet woe.

With wand'ring feet unblest, and fond of fame,  
I fought I know not what besides a name.Th. Or, sooth to say, did'st thou not hither come  
In search of gains more plenty than at home?

A rolling stone is, ever, bare of moss;

And, to their cost, green years old proverbs cross.

Co. Small need there was, in random search of gain,

To drive my pining flock athwart the plain,

To distant Cam. Fine gain at length, I trow,

To hoard up to myself such deal of woe!

My sheep quite spent through travel and ill fare,

And like their keeper ragged grown and bare,

The damp cold green sward for my nightly bed,

And some slant willow's trunk to rest my head.

Hard is to bear of pinching cold the pain;

And hard is want to the unpractis'd swain;

But neither want, nor pinching cold, is hard,

To blasting storms of calumny compar'd:

Unkind as hail it falls; the pelting shower

Destroys the tender herb and budding flower.

Th. Slander we shepherds count the vilest wrong:

And what wounds sorer than an evil tongue?

Co. Untoward lads, the wanton mien of spite,

Make mock of all the ditties I endite.

In vain, O Colinet, thy pipe, fo shrill,

Charms every vale, and gladdens every hill:

In vain thou seek'st the coverings of the grove,

In the cool shade to sing the pains of love:

Sing what thou wilt, ill-nature will prevail;

And every elf hath skill enough to rail.

But yet, though poor and artless be my vein,

Menalcas seems to like my simple strain:

And, while that he delighteth in my song,

Which to the good Menalcas doth belong,

Nor night, nor day, shall my rude music cease;

I ask no more, so I Menalcas please.

Th. Menalcas, lord of these fair fertile plains,

Preserves the sheep, and o'er the shepherds reigns:

For him our yearly wakes and feasts we hold,

And choote the fairest fillings from the fold;

He, good to all, who good deserves, shall give

Thy flock to feed, and thee at ease to live,

Shall curb the malice of unbridled tongues,

And bounteously reward thy rural songs.

Co. First, then, shall lightsome birds forget to fly,

The briny ocean turn to pastures dry,

And every rapid river cease to flow,

Ere I unmindful of Menalcas grow.

Th. This night thy care with me forget, and fold

Thy flock with mine, to ward th' injurious cold.

New milk, and clouted cream; mild cheese and curd,

With some remaining fruit of last year's hoard,

Shall be our evening fare; and, for the night,

Sweet herbs and moss, which gentle sleep invite:

And now behold the sun's departing ray,

O'er yonder hill, the sign of ebbing day:

With fogs the jovial hinds return from plow;

And unyok'd heifers, loitering homeward, slow.

68. Mr Pope's Pastorals next appeared, but in a different dress from those of Spenser and Phillips; for he has discarded all antiquated words, drawn his swains more modern and polite, and made his numbers

exquisitely harmonious: his eclogues therefore may be called *better poems*, but not better pastorals. We shall insert the eclogue he has inscribed to Mr Wycherly the beginning of which is in imitation of Virgil's first pastoral.

Pastoral.

Beneath the shade a spreading beech displays,

Hylas and Ægon sung their rural lays:

This mourn'd a faithless, that an abject love,

And Delia's name and Doris fill'd the grove.

Ye Mantuan nymphs, your sacred succour bring;

Hylas and Ægon's rural lays I sing.

Thou, whom the nine with Plautus' wit inspire,

The art of Terence, and Menander's fire:

Whose sense instructs us, and whose humour charms,

Whose judgment sways us, and whose spirit warms!

Oh, skill'd in nature! see the hearts of swains,

Their artless passions, and their tender pains.

Now setting Phœbus shone serenely bright,

And fleecy clouds were streak'd with purple light;

When tuneful Hylas, with melodious moan,

Taught rocks to weep, and made the mountains groan.

Go, gentle gales, and bear my sighs away!

To Delia's ear the tender notes convey.

As some fair turtle his lost love deplores,

And with deep murmurs fills the founding shores;

Thus, far from Delia, to the winds I mourn,

Alike unheard, un pity'd, and forlorn.

Go, gentle gales, and bear my sighs along!

For her, the feather'd quires neglect their song;

For her, the limes their pleasing shades deny;

For her, the lilies hang their head and die.

Ye flow'rs, that droop, forsaken by the spring,

Ye birds, that left by summer cease to sing,

Ye trees, that fade when autumn-heats remove,

Say, is not absence death to those who love?

Go, gentle gales, and bear my sighs away!

Curs'd be the fields that cause my Delia's stay:

Fade ev'ry blossom, wither ev'ry tree,

Die ev'ry flower, and perish all but she.

What I have said? where'er my Delia flies,

Let spring attend, and sudden flow'rs arise;

Let opening roses knotted oaks adorn,

And liquid amber drop from ev'ry thorn.

Go, gentle gales, and bear my sighs along!

The birds shall cease to tune their evening song,

The winds to breathe, the waving woods to move,

And streams to murmur, ere I cease to love.

Not bubbling fountains to the thirsty swain,

Not balmy sleep to lab'ring faint with pain,

Not show'rs to larks, or sunshine to bee,

Are half so charming as thy sight to me.

Go, gentle gales, and bear my sighs away!

Come, Delia, come; ah, why this long delay?

Thro' rocks and caves the name of Delia sounds;

Delia, each cave and echoing rock rebounds.

Ye pow'rs, what pleasing frenzy sooths my mind!

Do lovers dream, or is my Delia kind?

She comes, my Delia comes!—now cease, my lay;

And cease, ye gales, to bear my sighs away!

Next Ægon sung, while Windford groves admir'd;

Rehearse, ye muses, what yourselves inspir'd!

Resound ye hills, resound my mournful strain!

Of perjur'd Doris, dying I complain:

Here

Here where the mountains, less'ning as they rise,  
Lose the low vales, and steal into the skies;  
While lab'ring oxen, spent with toil and heat,  
In their loose traces from the field retreat;  
While curling smokes from village-tops are seen,  
And the fleet shades glide o'er the dusky green.

Refound, ye hills, refound my mournful lay!  
Beneath yon poplar oft we pass'd the day:  
Oft on the rind I car'd her am'rous vows,  
While she with garlands hung the bending boughs:  
The garlands fade, the boughs are worn away;  
So dies her love, and so my hopes decay.

Refound, ye hills, refound my mournful strain!  
Now bright Arcturus glads the teeming grain;  
Now golden fruits in loaded branches shine,  
And grateful clusters swell with floods of wine;  
Now blushing berries paint the yellow grove:  
Just Gods! shall all things yield returns but love?

Refound, ye hills, refound my mournful lay!  
The shepherds cry, "Thy flocks are left a prey."  
Ah! what avails it me the flocks to keep,  
Who lost my heart, while I preserv'd my sheep?  
Pan came, and ask'd, what magic caus'd my smart,  
Or what ill eyes malignant glances dart?  
What eyes but hers, alas! have pow'r to move?  
And is there magic but what dwells in love?

Refound, ye hills, refound my mournful strains!  
I'll fly from shepherds, flocks, and flow'ry plains.—  
From shepherds, flocks, and plains, I may remove,  
For sake mankind, and all the world—but love!  
I know thee, love! wild as the raging main,  
More fell than tygers on the Libyan plain:  
Thou wert from Etna's burning entrails torn,  
Got by fierce whirlwinds, and in thunder born.

Refound, ye hills, refound my mournful lay!  
Farewel, ye woods, adieu the light of day!  
One leap from yonder cliff shall end my pains.  
No more, ye hills, no more refound my strains!

Thus sung the shepherds till th' approach of night,  
The skies yet blushing with departing light,  
When falling dews with spangles deck'd the glade,  
And the low sun had lengthen'd ev'ry shade.

To these pastorals, which are written agreeably to the taste of antiquity, and the rules above prescribed, we shall beg leave to subjoin another that may be called *burlesque pastoral*, wherein the ingenious author, Mr Gay, has ventured to deviate from the beaten road, and described the shepherds and ploughmen of our own time and country, instead of those of the Golden Age, to which the modern critics confine the pastoral. His six pastorals, which he calls the *Shepherd's Week*, are a beautiful and lively representation of the manners, customs, and notions of our rustics. We shall insert the first of them, entitled, *The Squabble*, wherein two clowns try to out-do each other in singing the praises of their sweet-hearts, leaving it to a third to determine the controversy. The persons named are *Lobbin Clout*, *Cuddy*, and *Cloddipole*.

*Lob.* Thy younglings, Cuddy, are but just awake;  
No thistle shrill the bramble-bush forsake;  
No chirping lark the welkin seen\* invokes;  
No damsel yet the swelling udder strokes;  
O'er yonder hill does feat† the dawn appear;  
Then why does Cuddy leave his cott to rear‡?

*Cud.* Ah Lobbin Clout! I ween† my plight is guest; *Pastoral.*  
For he that loves, a stranger is to rest. *† Conceive.*  
If swains belye not, thou hast prov'd the smart,  
And Blouzalinda's mistress of thy heart.  
This rising rear betokeneth well thy mind;  
Those arms are fold'd for thy Blouzaland.  
And well, I trow, our piteous plights agree;  
Thee Blouzaland smites, Buxoma me.

*Lob.* Ah Blouzaland! I love thee more by half,  
Than deer their fawns, or cows the new-fall'n calf.  
Woe worth the tongue, may blisters fore it gail,  
That names Buxoma Blouzaland withal!

*Cud.* Hold, witless Lobbin Clout, I thee advise,  
Lest blisters fore on thy own tongue arise.  
Lo yonder Cloddipole, the blithsome swain,  
The wisest lout of all the neighb'ring plain!  
From Cloddipole we learnt to read the skies,  
To know when hail will fall, or winds arise.  
He taught us erst\* the heifer's tail to view, *\* Formerly*  
When stuck aloft, that show'r's would straight ensue:  
He first that useful secret did explain,  
That pricking corns foretold the gath'ring rain.  
When wallows fleet soar high and sport in air,  
He told us that the welkin would be clear.  
Let Cloddipole then hear us twain rehearse,  
And praise his sweet-heart in alternate verse.  
I'll wager this same oaken staff with thee,  
That Cloddipole shall give the prize to me.

*Lob.* See this tobacco-pouch, that's lin'd with hair,  
Made of the skin of sleekest fallow-deer:  
'This pouch, that's tied with tape of reddest hue,  
I'll wager, that the prize shall be my due.

*Cud.* Begin thy carols then, thou vaunting slouch;  
Be thine the oaken staff, or mine the pouch.

*Lob.* My Blouzaland is the blithest lass,  
Than primrose sweeter, or the clover-grass.  
Fair is the king-cup that in meadow blows,  
Fair is the daisy that beside her grows;  
Fair is the gilly-flow'r of gardens sweet,  
Fair is the marygold, for pottage meet:  
But Blouzaland's than gilly-flow'r more fair,  
Than daisy, marygold, or king-cup rare.

*Cud.* My brown Buxoma is the feastiest maid  
That e'er at wake delightful gambol play'd;  
Clean as young lambskins, or the goose's down,  
And like the goldfinch in her Sunday gown.  
The witless lamb may sport upon the plain,  
The frisking kid delight the gaping swain;  
The wanton calf may skip with many a bound,  
And my cur Tray play deftest† feats around: *† Nimblest.*  
But neither lamb, nor kid, nor calf, nor Tray,  
Dance like Buxoma on the first of May.

*Lob.* Sweet is my toil when Blouzaland is near;  
Of her bereft, 'tis winter all the year.  
With her no sultry summer's heat I know;  
In winter, when she's nigh, with love I glow.  
Come, Blouzaland, ease thy swain's desire,  
My summer's shadow, and my winter's fire!

*Cud.* As with Buxoma once I work'd at hay,  
E'en noon-tide labour seem'd an holiday;  
And holidays, if haply she were gone,  
Like worky-days I wuld'ld would soon be done.  
Eftsoons‡, O sweet-heart kind, my love repay, *‡ Very soon.*  
And all the year shall then be holiday.

*Lob.*

\* Shining  
or bright  
sky.  
† Scarce.

‡ Early.

Pastoral.

*Lob.* As Blouzalinda, in a gamefome mood,

Behind a bay-cock loudly laughing food,

I fliely ran and snatched a hasty kiſs;

She wip'd her lips, nor took it much amiſs.

Believe me, Cuddy, while I'm bold to ſay,  
Her breath was ſweeter than the ripeſt hay.

*Cud.* As my Buxoma, in a morning fair,

Wagglily

With gentle finger ſtroak'd her milky care,

quaintly \* ſtole a kiſs; at firſt, 'tis true,

She frown'd, yet after granted one or two,

Lobbin, I ſwear, believe who will my vows,

Her breath by far excell'd the breathing cow's.

*Lob.* Leek to the Welch, to Dutchmen butter's dear,

Of Iriſh ſwains potatoes are the cheer;

Oats for their ſeaſts the Scottiſh ſhepherds grind,

Sweet turnips are the food of Blouzalind;

While ſhe loves turnips, butter I'll deſpiſe,

Nor leeks, nor oatmeal, nor potatoes prize.

*Cud.* In good roaſt-beef my landlord ticks his knife,

The capon fat delights his dainty wife;

Pudding our parſon eats, the ſquire loves hare;

But white-pot thick is my Buxoma's fare.

While ſhe loves white-pot, capon ne'er ſhall be,

Nor hare, nor beef, nor pudding, food for me.

*Lob.* As once I play'd at blind-man's buff, it hap't

About my eyes the towel thick was wrapt:

I miſ'd the ſwains, and ſeiz'd on Blouzalind;

True ſpeaks that ancient proverb, Love is blind.

*Cud.* As at hot-cockles once I laid me down,

And felt the weighty hand of many a clown;

Buxoma gave a gentle tap, and I

Quick rote, and read ſoft miſchief in her eye.

*Lob.* On two near elms, the ſlacken'd cord I hung;

Now high, now low, my Blouzalinda ſwung:

With the rude wind her rump'd garment roſe,

And ſhow'd her taper leg and ſcarlet hoſe.

*Cud.* Acroſs the fallen oak the plank I laid,

And myſelf poiſ'd againſt the tott'ring maid:

High leapt the plank, and down Buxoma fell;

I ſpy'd—but faithful ſweethearts never tell.

*Lob.* This riddle, Cuddy, if thou can'ſt, explain,

This wily riddle puzzles ev'ry ſwain:

*What ſlow'r is that which bears the virgin's name,*

\* Marygold. *The richeſt metal join'd with the ſame? \**

*Cud.* Answer, thou carle, and judge this riddle right,

I'll frankly own thee for a cunning wight:

*What ſlow'r is that which royal honour craves,*

† Roſemary. *Adjoin the virgin, and 'tis ſrown on graves? †*

*Cud.* Forbear, contending jouts, give o'er your ſtrains;

An oaken ſtiff each merits for his pains.

But ſee the ſun-beams bright to labour warn,

And gild the thatch of goodman Hodge's barn.

Your herbs for want of water ſtand a-dry;

They're weary of your ſongs—and ſo am I.

We have given the rules uſually laid down for paſtoral writing, and exhibited ſome examples which were written on this plan; but we have to obſerve, that this poem may ſometimes partake of more dignity, and aſpire even to the ſublime, without deviating from nature and right reaſon. The ſublime which ariſes from tumults, wars, and what are too often falſely called *great actions*, the paſtoral abhors; but that which is blended with the tender and pathetic may be introduced with propriety and elegance. And indeed

if we conſider that the firſt ſhepherds were many of them princes, (for that Abraham, Moſes, and David, were ſuch, we have the teſtimony of the Scriptures), it will ſeem ſomewhat extraordinary that ſuch pains ſhould have been taken to exclude the ſublime from paſtoral writing; and we ſhall be inclined to admit Virgil's *Pellio*, the *Song of Solomon*, and Pope's *Meſſiah*, as paſtorals, till better reaſons are offered to the contrary than have yet appear'd: for the true characteriſtic of paſtoral, and what diſtinguiſhes it from other writings, is its ſole confinement to rural affairs; and if this be obſerved, it can loſe nothing of its nature by any elevation of ſentiment or diſtion.

#### SECT. V. Of Didactic or Preceptive Poetry.

69. THE method of writing precepts in verſe, and embellishing them with the graces of poetry, had its riſe, we may ſuppoſe, from a due conſideration of the frailties and perverseneſs of human nature; and was intended to engage the affections, in order to improve the mind and amend the heart.

Didactic or preceptive poetry, has been uſually employed either to illuſtrate and explain our moral duties, our philoſophical inquiries, our buſineſs and pleaſures; or in teaching the art of criticiſm or poetry itſelf. It may be adapted, however, to any other ſubject; and may in all caſes, where inſtruction is deſigned, be employed to good purpoſe. Some ſubjects, indeed, are more proper than others, as they admit of more poetical ornaments, and give a greater latitude to genius: but whatever the ſubject is, thoſe precepts are to be laid down that are the moſt uſeful; and they ſhould follow each other in a natural eaſy method, and be delivered in the moſt agreeable engaging manner. What the proſe writer tells you ought to be done, the poet often conveys under the form of a narration, or ſhows the neceſſity of in a deſcription; and by repreſenting the action as done, or doing, conceals the precept that ſhould enforce it. The poet likewiſe, inſtead of telling the whole truth, or laying down all the rules that are requiſite, ſelects ſuch parts only as are the moſt pleaſing, and communicates the reſt indirectly, without giving us an open view of them; yet takes care that nothing ſhall eſcape the reader's notice with which he ought to be acquainted. He diſcloſes juſt enough to lead the imagination into the parts that are concealed; and the mind, ever gratified with its own diſcoveries, is complimented with exploring and finding them out; which, though done with eaſe, ſeems ſo conſiderable, as not to be obtained but in conſequence of its own adroineſs and ſagacity.

But this is not ſufficient to render didactic poetry always pleaſing: for where precepts are laid down one after another, and the poem is of conſiderable length, the mind will require ſome recreation and reſreſhment by the way; which is to be procured by reaſonable moral reflections, pertinent remarks, familiar ſimiles, and deſcriptions naturally introduced, by alluſions to ancient hiſtories or fables, and by ſhort and pleaſant digreſſions and excuſions into more noble ſubjects, ſo aptly brought in, that they may ſeem to have a remote relation, and be of a piece with the poem. By thus varying the form of inſtruction, the poet gives life to his precepts, and awakens and ſecures our attention, without permitting us to ſee by what means we

Didactic.

Didactic.

are thus captivated: and his art is the more to be admired, because it is so concealed as to escape the reader's observation.

The style, too, must maintain a dignity suitable to the subject, and every part be drawn in such lively colours, that the things described may seem as if presented to the reader's view.

But all this will appear more evident from example; and though entire poems of this kind are not within the compass of our design, we shall endeavour to select such passages as will be sufficient to illustrate the rules we have here laid down.

We have already observed, that, according to the usual divisions, there are four kinds of didactic poems, viz. those that respect our moral duties, our philosophical speculations, our business and pleasures, or that give precepts for poetry and criticism.

70. On the first subject, indeed, we have scarce any thing that deserves the name of poetry, except Mr Pope's *Essay on Man*, and his *Ethic Epistles*; to which therefore we refer as examples.

71. II. Those preceptive poems that concern philosophical speculations, though the subject is so pregnant with matter, affords such a field for fancy, and is so capable of every decoration, are but few. Lucretius is the most considerable among the ancients who has written in this manner; and among the moderns we know of none but small detached pieces, except the poem called *Anti-Lucretius*, which has not yet received an English dress, and Dr Akenfide's *Pleasures of the Imagination*; both which are worthy of our admiration. Some of the small pieces are also well executed; and there is one entitled the *Universe*, written by Mr Baker, from which we shall borrow an example.

The author's scheme is in some measure coincident with Mr Pope's, so far especially as it tends to restrain the pride of man, with which design it was professedly written.

The passage we have selected is that respecting the planetary system.

Unwife! and thoughtless! impotent! and blind!

Can wealth, or grandeur, satisfy the mind?

Of all those pleasures mortals most admire,

Is there one joy sincere, that will not tire?

Can love itself endure? or beauty's charms

Afford that bliss we fancy in its arms?—

Then, let thy soul more glorious aims pursue:

Have thy CREATOR and his works in view.

Be these thy study: hence thy pleasures bring:

And drink large draughts of wisdom from its springs;

That spring, of heaven perfect joy, and calm repose,

And bliss content, and peace eternal, flows.

Observe how regular the Planets run,

In stated times, their courses round the Sun.

Different their bulk, their distance, their career,

And different much the compass of their year:

Yet all the same eternal laws obey,

While God's unerring finger points the way.

First Mercury, amidst full tides of light,

Rolls next the sun, through his small circle bright.

All that dwell here must be refin'd and pure:

Bodies like ours such ardour can't endure:

Our Earth would blaze beneath so fierce a ray,

And all its marble mountains melt away.

Fair Venus, next, fulfils her larger round,

With softer beams, and milder glory crown'd.

Friend to mankind, she glitters from afar,

Now the bright ev'ning, now the morning star.

More distant still, our Earth comes rolling on,

And forms a wider circle round the sun:

With her the Moon, companion ever dear!

Her course attending through the shining year.

See, Mars, alone, runs his appointed race,

And measures out, exact, the destin'd space:

Nor nearer does he wind, nor farther stray,

But finds the point whence first he roll'd away.

More yet remote from day's all-cheering source,

Vast Jupiter performs his constant course:

Four friendly moons, with borrow'd lustre, rise.

Bellow their beams benign, and light his skies.

Farthest and last, scarce warm'd by Phœbus' ray,

Through his vast orbit Saturn wheels away.

How great the change could we be waisted there!

How slow the seasons! and how long the year!

One moon, on us, reflects its cheerful light:

There, five attendants brighten up the night.

Here, the blue firmament bedeck'd with stars,

There, over-head, a lucid arch appears,

From hence how large, how strong, the sun's bright ball!

But seen from thence, how languid, and how small!—

When the keen north with all its fury blows,

Congels the floods, and forms the fleecy snows,

'Tis heat intense to what can there be known:

Warmer our poles than is its burning zone.

Who there inhabit must have other pow'rs,

Juices, and veins, and sense, and life, than ours.

One moment's cold, like theirs, would pierce the bone,

Freeze the heart-blood, and turn us all to stone.

Strange and amazing must the difference be,

'Twixt this dull Planet and bright Mercury:

Yet reason says, nor can we doubt at all,

Millions of beings dwell on either ball,

With constitutions fitted for that spot,

Where Providence, all-wise, has fix'd their lot.

Wond'rous art thou, O God, in all thy ways!

Their eyes to thee let all thy creatures raise;

Adore thy grandeur, and thy goodness praise.

Ye sons of men! with satisfaction know,

God's own right hand dispenses all below:

Nor good nor evil does by chance befall;

He reigns supreme, and he directs it all.

At his command, affrighting human-kind,

Comets drag on their blazing lengths behind:

Nor, as we think, do they at random rove,

But, in determin'd times, through long ellipses move.

And tho' sometimes they near approach the sun,

Sometimes beyond our system's orbit run;

Throughout their race they act their Maker's will,

His pow'r declare, his purposes fulfil.

72. III. Of those preceptive poems that treat of

the business and pleasures of mankind, Virgil's *Georgics*

claims our first and principal attention. In these he

has laid down the rules of husbandry in all its branches

with the utmost exactness and perspicuity, and at the

same time embellished them with all the beauties and

graces of poetry. Though his subject was husbandry,

he has delivered his precepts, as Mr Addison observes,

not with the simplicity of a ploughman, but with the

address

*Didactic.* address of a poet: the meanest of his rules are laid down with a kind of grandeur; and he breaks the clods, and tresses about the dung, with an air of gracefulness. Of the different ways of conveying the same truth to the mind, he takes that which is pleasantest; and this chiefly distinguishes poetry from prose, and renders Virgil's rules of husbandry more delightful and valuable than any other.

These poems, which are esteemed the most perfect of the author's works, are, perhaps, the best that can be proposed for the young student's imitation in this manner of writing; for the whole of his *Georgics* is wrought up with wonderful art, and decorated with all the flowers of poetry.

74. IV. Of those poems which give precepts for the recreations and pleasures of a country life, we have several in our own language that are justly admired. As the most considerable of those diversions, however, are finely treated by Mr Gay in his *Rural Sports*, we particularly refer to that poem.

We should here treat of those preceptive poems that teach the art of poetry itself, of which there are many that deserve particular attention; but we have anticipated our design, and rendered any farther notice of them in a manner useless, by the observations we have made in the course of this treatise. We ought however to remark, that Horace was the only poet among the ancients who wrote precepts for poetry in verse: at least his epistle to the Pisos is the only piece of the kind that has been handed down to us; and that is so perfect, it seems almost to have precluded the necessity of any other. Among the moderns we have several that are justly admired; as Boileau, Pope, &c.

74. Poets who write in the preceptive manner should take care to choose such subjects as are worthy of their muse, and of consequence to all mankind; for to bestow both parts and pains to teach people trifles that are unworthy of their attention, is to the last degree ridiculous.

Among poems of the useful and interesting kind, Dr Armstrong's *Art of Preserving Health* deserves particular recommendation, as well in consideration of the subject, as of the elegant and masterly manner in which he has treated it; for he has made those things, which are in their own nature dry and unentertaining, perfectly agreeable and pleasing, by adhering to the rules observed by Virgil and others, in the conduct of these poems.

75. With regard to the style or dress of these poems, it should be so rich as to hide the nakedness of the subject, and the barrenness of the precepts should be lost in the lustre of the language. "It ought to abound in the most bold and forcible metaphors, the most glowing and picturesque epithets; it ought to be elevated and enlivened by pomp of numbers and majesty of words, and by every figure that can lift a language above the vulgar and current expressions." One may add, that in no kind of poetry (not even in the sublime ode) is beauty of expression so much to be regarded as in this. For the epic writer should be very cautious of indulging himself in too florid a manner of expression, especially in the dramatic parts of his fable, where he introduces dialogue: and the writer of tragedy cannot fall into so nauseous and unnatural an af-

fection, as to put laboured descriptions, pompous epithets, studied phrases, and high-flown metaphors, into the mouths of his characters. But as the didactic poet speaks in his own person, it is necessary and proper for him to use a brighter colouring of style, and to be more studious of ornament. And this is agreeable to an admirable precept of Aristotle, which no writer should ever forget,—"That diction ought most to be laboured in the unactive, that is, the descriptive, parts of a poem, in which the opinions, manners, and passions of men are not represented; for too glaring an expression obscures the manners and the sentiments."

We have already observed that any thing in nature may be the subject of this poem. Some things however will appear to more advantage than others, as they give a greater latitude to genius, and admit of more poetical ornaments. Natural history and philosophy are copious subjects. Precepts in these might be decorated with all the flowers in poetry; and, as Dr Trapp observes, how can poetry be better employed, or more agreeably to its nature and dignity, than in celebrating the works of the great Creator, and describing the nature and generation of animals, vegetables, and minerals; the revolutions of the heavenly bodies; the motions of the earth; the flux and reflux of the sea; the cause of thunder, lightning, and other meteors; the attraction of the magnet; the gravitation, cohesion, and repulsion of matter; the impulsive motion of light; the slow progression of sounds; and other amazing phenomena of nature. Most of the arts and sciences are also proper subjects for this poem; and none are more so than its two sister arts, painting and music. In the former, particularly, there is room for the most entertaining precepts concerning the disposal of colours; the arrangement of lights and shades; the secret attractives of beauty; the various ideas which make up the one; the distinguishing between the attitudes proper to either sex, and every passion; the representing prospects of buildings, battles, or the country; and lastly, concerning the nature of imitation, and the power of painting. What a boundless field of invention is here? What room for description, comparison, and poetical fable? How easy the transition, at any time, from the draught to the original, from the shadow to the substance? and from hence, what noble excursions may be made into history, into panegyric upon the greatest beauties or heroes of the past or present age?

#### SECT. VII. Of the Epistle.

76. THIS species of writing, if we are permitted to lay down rules from the examples of our best poets, admits of great latitude, and solicits ornament and decoration: yet the poet is still to consider that the true character of the epistle is ease and elegance; nothing therefore should be forced or unnatural, laboured, or affected, but every part of the composition breathe an easy, polite, and unconstrained freedom.

It is suitable to every subject; for as the epistle takes place of discourse, and is intended as a sort of distant conversation, all the affairs of life and researches into nature may be introduced. Those, however, which are fraught with compliment or condolence, than

Epistle.

contain a description of places, or are full of pertinent remarks, and in a familiar and humorous way describe the manners, vices, and follies of mankind, are the best; because they are most suitable to the true character of epistolary writing, and (business set apart) are the usual subjects upon which our letters are employed.

All farther rules and directions are unnecessary; for this kind of writing is better learned by example and practice, than by precept. We shall therefore, in conformity to our plan, select a few epistles for the reader's imitation; which, as this method of writing has of late much prevailed, may be best taken, perhaps, from our modern poets.

77. The following letter from Mr Addison to lord Halifax, contains an elegant description of the curiosities and places about Rome, together with such reflections on the inestimable blessings of liberty as must give pleasure to every Briton, especially when he sees them thus placed in direct opposition to the baneful influence of slavery and oppression which are ever to be seen among the miserable inhabitants of those countries.

While you, my lord, the rural shades admire,  
And from Britannia's public posts retire,  
Nor longer, her ungrateful sons to please,  
For their advantage sacrifice your ease;  
Me into foreign realms my fate conveys,  
Through nations fruitful of immortal lays,  
Where the soft season and inviting clime  
Conspire to trouble your repose with rhyme.

For wheresoe'er I turn my ravish'd eyes,  
Gay gilded scenes and shining prospects rise,  
Poetic fields encompass me around,  
And still I seem to tread on classic ground;  
For here the muse so oft her harp has strung,  
That not a mountain rears its head unsung,  
Renown'd in verse each shady thicket grows,  
And ev'ry stream in heav'nly numbers flows.

How am I pleas'd to search the hills and woods  
For rising springs and celebrated floods;  
To view the Nar, tumultuous in his course,  
And trace the smooth Clitumnus to his source;  
To see the Mincio draw his wat'ry store  
Through the long windings of a fruitful shore,  
And hoary Albulæ's infected tide  
O'er the warm bed of smoking sulphur glide!

Fir'd with a thousand raptures, I survey  
Eridanus through flow'ry meadows stray,  
The king of floods! that, rolling o'er the plains,  
The tow'ring Alps of half their moisture drains,  
And, proudly swoln with a whole winter's snows,  
Distributes wealth and plenty where he flows.

Sometimes, misguided by the tuneful throng,  
I look for streams immortaliz'd in song,  
That lost in silence and oblivion lie,  
(Dumb are their fountains and their channels dry)  
Yet run for ever by the muse's skill,  
And in the smooth description murmur still.

Sometimes to gentle Tiber I retire,  
And the sam'd river's empty shores admire,  
That, destitute of strength, derives its course  
From thirsty urns, and an unfruitful source;

Yet sung so often in poetic lays,  
With scorn the Danube and the Nile surveys;  
So high the deathless muse exalts her theme!  
Such was the Boyn, a poor inglorious stream,  
That in Hibernian vales obscurely stray'd,  
And unobserv'd in wild meanders play'd;  
Till, by your lines and Naïus's sword renown'd,  
Its rising billows through the world resound,  
Where'er the hero's godlike acts can pierce,  
Or where the fame of an immortal virtue.

Oh could the muse my ravish'd breast inspire  
With warmth like yours, and raise an equal fire,  
Unnumber'd beauties in my verse should shine,  
And Virgil's Italy should yield to mine!

See how the golden groves around me smile,  
That shun the coasts of Britain's stormy isle,  
Or when transplanted and preserv'd with care,  
Curse the cold clime, and starve in northern air.  
Here kindly warmth their mounting juice ferments  
To nobler tastes, and more exalted scents:  
Ev'n the rough rocks with tender myrtles bloom,  
And trodden weeds send out a rich perfume.  
Bear me, some god, to Baia's gentle seats,  
Or cover me in Umbria's green retreats;  
Where western gales eternally reside,  
And all the seasons lavish all their pride:  
Blossoms, and fruits, and flow'rs together rise,  
And the whole year in gay confusion lies.

Immortal glories in my mind revive,  
And in my soul a thousand passions strive,  
When Rome's exalted beauties I descry  
Magnificent in piles of ruin lie.  
An amphitheatre's amazing height  
Here fills my eye with terror and delight,  
That on its public shows unpeopled Rome,  
And held uncrowded nations in its womb:  
Here pillars rough with sculpture pierce the skies;  
And here the proud triumphal arches rise,  
Where the old Romans deathless acts, display'd,  
Their base degenerate progeny upbraid:  
Whole rivers here forsake the fields below,  
And wond'ring at their height thro' airy channels flow.

Still to new scenes my wand'ring muse retires;  
And the dumb show of breathing rocks admires;  
Where the smooth chisel all its force has shown,  
And soften'd into flesh the rugged stone.  
In solemn silence, a majestic band,  
Heroes, and gods, and Roman consuls stand,  
Stern tyrants, whom their cruelties renown,  
And emperors in Parian marble frown;  
While the bright dames, to whom they humbly su'd,  
Still show the charms that their proud hearts subdu'd.

Fain would I Raphael's godlike art rehearse,  
And show th' immortal labours in my verse,  
Where from the mingled strength of shade and light  
A new creation rises to my sight,  
Such heav'nly figures from his pencil flow,  
So warm with life his blended colours glow.  
From theme to theme with secret pleasure tost,  
Amidst the soft variety I'm lost.

Here pleasing airs my ravish'd soul confound  
With circling notes and labyrinths of sound;  
Here domes and temples rise in distant views,  
And opening palaces invite my muse.

Epistle.

How

Epistle.

How has kind heav'n adorn'd the happy land,  
And scatter'd blessings with a wasteful hand!  
But what avail her unexhausted stores,  
Her blooming mountains, and her sunny shores,  
With all the gifts that heav'n and earth impart,  
The smiles of nature, and the charms of art,  
While proud oppression in her valleys reigns,  
And tyranny usurps her happy plains?  
The poor inhabitant beholds in vain  
The red'ning orange and the swelling grain:  
Joyless he sees the growing oils and wines,  
And in the myrtle's fragrant shade repines:  
Starves, in the midst of nature's bounty curst,  
And in the loaden vineyard dies for thirst.

O liberty, thou goddess heav'nly bright,  
Profuse of bliss, and pregnant with delight!  
Eternal pleasures in thy presence reign,  
And smiling plenty leads thy wanton train;  
Eas'd of her load, subjection grows more light,  
And poverty looks cheerful in thy fight;  
Thou mak'st the gloomy face of nature gay,  
Giv'st beauty to the sun, and pleasure to the day.

Thee, goddess, thee, Britannia's isle adores;  
How has she oft exhausted all her stores,  
How oft in fields of death thy presence sought,  
Nor thinks the mighty prize too dearly bought!  
On foreign mountains may the sun refine  
The grape's soft juice, and mellow it to wine,  
With citron groves adorn a distant soil,  
And the fat olive swell with floods of oil:  
We envy not the warmer clime, that lies  
In ten degrees of more indulgent skies,  
Nor at the coarseness of our heav'n repine,  
Though o'er our heads the frozen pleiads shine:  
'Tis liberty that crowns Britannia's isle, [smile.  
And makes her barren rocks and her bleak mountains

Others with tow'ring piles may please the sight,  
And in their proud aspiring domes delight;  
A nicer touch to the stretch'd canvas give,  
Or teach their animated rocks to live:

'Tis Britain's care to watch o'er Europe's fate,  
And hold in balance each contending state,  
To threaten bold presumptuous kings with war,  
And answer her afflicted neighbour's pray'r.  
The Dane and Swede, rous'd up by fierce alarms,  
Bless the wise conduct of her pious arms:  
Soon as her fleets appear, their terrors cease,  
And all the northern world lies hush'd in peace.

Th' ambitious Gaul beholds with secret dread  
Her thunder aim'd at his aspiring head,  
And fain her godlike sons would disunite  
By foreign gold, or by domestic spite;  
But strives in vain to conquer or divide,  
Whom Nassau's arms defend and counsels guide.

Fir'd with the name, which I so oft have found  
The distant climes and diff'rent tongues resound,  
I bridle in my struggling muse with pain,  
That longs to launch into a bolder strain.  
But I've already troubled you too long,  
Nor dare attempt a more advent'rous song:  
My humble verse demands a softer theme,  
A painted meadow, or a purling stream;  
Unfit for heroes; whom immortal lays,  
And lines like Virgil's, or like yours, should praise.

78. There is a fine spirit of freedom, and love of liberty, displayed in the following letter from lord Lyttelton to Mr Pope; and the message from the shade of Virgil, which is truly poetical, and justly preceptive, may prove an useful lesson to future bards.

*From Rome, 1730.*

IMMORTAL bard! for whom each muse has wove  
The fairest garlands of the Aonian grove;  
Preserv'd, our drooping genius to restore,  
When Addison and Congreve are no more;  
After so many stars extinct in night,  
The darken'd age's last remaining light!  
To thee from Latian realms this verse is writ,  
Inspir'd by memory of ancient wit:  
For now no more these climes their influence boast,  
Fall'n is their glory, and their virtue lost;  
From tyrants, and from priests, the mules fly,  
Daughters of reason and of liberty.

Nor Baiz nor umbria's plain they love,  
Nor on the banks of Nar or Mincia rove;  
To Thames's flow'ry borders they retire,  
And kindle in thy breast the Roman fire.  
So in the shades, where cheer'd with summer rays  
Melodious linnets warbled sprightly lays,  
Soon as the faded, falling leaves complain  
Of gloomy winter's un auspicious reign,  
No tuneful voice is heard of joy or love,  
But mournful silence saddens all the grove.

Unhappy Italy! whose alter'd state  
Has felt the worst severity of fate:  
Not that barbarian hands her faces broke,  
And bow'd her haughty neck beneath their yoke;  
Nor that her palaces to earth are thrown,  
Her cities desert, and her fields unown;  
But that her ancient spirit is decay'd,  
That sacred wisdom from her bounds is fled,  
That there the source of science flows no more,  
Whence its rich streams supply'd the world before.

Illustrious names! that once in Latium shin'd,  
Born to instruct and to command mankind;  
Chiefs, by whose virtue mighty Rome was rais'd,  
And poets, who those chiefs sublimely praise'd!  
Oft I the traces you have left explore,  
Your ashes visit, and your urns adore;  
Oft kiss, with lips devout, some mould'ring stone,  
With ivy's venerable shade o'ergrown;  
Those hallow'd ruins better pleas'd to see,  
Than all the pomp of modern luxury.

As late on Virgil's tomb fresh flow'rs I strow'd,  
While with th' inspiring muse my bosom'd glow'd,  
Crown'd with eternal bays, my ravish'd eyes  
Beheld the poet's awful form arise:  
Stranger, he said, whose pious hand has paid  
These grateful rites to thy attentive shade,  
When thou shalt breathe thy happy native air,  
To Pope this message from his master bear.

Great bard, whose numbers I myself inspire,  
To whom I gave my own harmonious lyre,  
If high exalted on the throne of wit,  
Near me and Homer thou aspire to sit;  
No more let meaner satire dim the rays  
That flow majestic from thy noble bays.  
In all the flow'ry paths of Pindus stray:

But shun that thorny, that unpleasing way ;  
Nor, when each soft engaging muse is thine,  
Addresses the least attractive of the nine.

Of thee more worthy were the task to raise  
A lasting column to thy country's praise,  
To sing the land, which yet alone can boast  
That liberty corrupted Rome has lost ;  
Where science in the arms of peace is laid,  
And plants her palm beneath the olive's shade.  
Such was the theme for which my lyre I strung,  
Such was the people whose exploits I sung ;  
Brave, yet refin'd, for arms and arts renown'd,  
With diff'rent bays by Mars and Phoebus crown'd,  
Dauntless opposers opposers of tyrannic sway,  
But pleas'd a mild AUGUSTUS to obey.

If these commands submissive thou receive,  
Immortal and unblam'd thy name shall live ;  
Envy to black Cocytus shall retire,  
And howl with furies in tormenting fire ;  
Approving time shall consecrate thy lays,  
And join the patriot's to the poet's praise.

79. The great use of medals is properly described  
in the ensuing elegant epistle from Mr Pope to Mr  
Addison; and the extravagant passion which some  
people entertain only for the colour of them, is very  
agreeably and very justly ridiculed.

SEE the wild waste of all devouring years !  
How Rome her own sad sepulchre appears !  
With nodding arches, broken temples spread !  
The very tombs now vanish like their dead !  
Imperial wonders rais'd on nations spoil'd,  
Where mix'd with slaves the groaning martyr toil'd !  
Huge theatres, that now unpeopled woods,  
Now drain'd a distant country of her floods !  
Fances, which admiring gods with pride survey,  
Statues of men, scarce less alive than they !  
Some felt the silent stroke of mould'ring age,  
Some hostile fury, some religious rage ;  
Barbarian blindness, Christian zeal conspire,  
And Papal piety, and Gothic fire.  
Perhaps, by its own ruin sav'd from flame,  
Some bury'd marble half preserves a name ;  
That name the learn'd with fierce disputes pursue,  
And give to Titus old Vespasian's due.

Ambition sigh'd : She found it vain to trust  
The faithless column and the crumbling bust ;  
Huge moles, whose shadow stretch'd from shore to shore,  
Their ruins perish'd, and their place no more !  
Convinc'd, she now contracts her vast design,  
And all her triumphs shrinks into a coin.  
A narrow orb each crowded conquest keeps,  
Beneath her palm here sad Judaea weeps ;  
Now scantier limits the proud arch confine,  
And scarce are seen the prostrate Nile or Rhine ;  
A small Euphrates through the piece is roll'd,  
And little eagles waves their wings in gold.

The medal, faithful to its charge of fame.  
Through climes and ages bears each form and name :  
In one short view subjected to our eye,  
Gods, emp'rors, heroes, sages, beauties, lie.  
With sharpen'd sight pale antiquaries pore,  
The inscription value, but the rust adore.

This the blue varnish, that the green endears,  
The sacred rust of twice ten hundred years !  
To gain Precennius one employs his schemes,  
One grasps a Cecrops in ecstatic dreams.  
Poor Vadius, long, with learned spleen devour'd,  
Can taste no pleasure since his shield was scour'd ;  
And Curio, restless by the fair one's side,  
Sighs for an Otho, and neglects his bride.

Theirs is the vanity, the learning thine :  
Touch'd by thy hand, again Rome's glories shine ;  
Her gods and god-like heroes rise to view,  
And all her faded garlands bloom anew.  
Nor blush these studies thy regard engage ;  
These pleas'd the fathers of poetic rage ;  
The verse and sculpture bore an equal part,  
And art reflected images to art.

Oh when shall Britain, conscious of her claim,  
Stand emulous of Greek and Roman fame ?  
In living medals see her wars enroll'd,  
And vanquish'd realms supply recording gold ?  
Here, rising bold, the patriot's honest face ;  
There, warriors frowning in historic brass ?  
Then future ages with delight shall see  
How Plato's, Bacon's, Newton's looks agree ;  
Or in fair series laurel'd bards be shown,  
A Virgil there, and here an Addison.  
Then shall thy CRAGGS (and let me call him mine)  
On the cast ore, another Pollio shine ;  
With aspect open shall erect his head,  
And round the orb in lasting notes be read,  
" Statesman, yet friend to truth ! of soul sincere,  
" In action faithful, and in honour clear ;  
" Who broke no promise, serv'd no private end,  
" Who gain'd no title, and who lost no friend ;  
" Ennobled by himself, by all approv'd,  
" Prais'd, wept, and honour'd, by the muse he lov'd.

80. The following letter from Mr Philips to the  
earl of Dorset is entirely descriptive ; but is one of  
those descriptions which will be ever read with de-  
light.

*Copenhagen, March 9. 1709.*

FROM frozen climes, and endless tracts of snow,  
From streams which northern winds forbid to flow,  
What present shall the muse to Dorset bring,  
Or how, so near the pole, attempt to sing ?  
The hoary winter here conceals from sight  
All pleasing objects which to verse invite.  
The hills and dales, and the delightful woods,  
The flow'ry plains, and silver streaming floods,  
By snow disguis'd, in bright confusion lie,  
And with one dazzling waste fatigue the eye.

No gentle breathing breeze prepares the spring,  
No birds within the desert region sing :  
The ships, unmov'd, the boisterous winds defy,  
While rattling chariots o'er the ocean fly.  
The vast Leviathan wants room to play,  
And spout his waters in the face of day ;  
The starving wolves along the main sea spawl,  
And to the moon in icy valleys howl.  
O'er many a thinning league the level main  
Here spreads itself into a glassy plain :

There

Epistle.

There solid billows of enormous size,  
Alps of green ice, in wild disorder rise.  
And yet but lately have I seen, ev'n here,  
The winter in a lovely drefs appear.  
'E're yet the clouds let fall the treasur'd snow,  
Or winds begin through hazy skies to blow,  
At ev'ning a keen eastern breeze arose,  
And the descending rain unsully'd froze ;  
Soon as the silent shades of night withdrew,  
The ruddy morn disclos'd at once to view  
The face of nature in a rich disguise,  
And brighten'd ev'ry object to my eyes :  
For ev'ry shrub, and ev'ry blade of grass,  
And ev'ry pointed thorn, seem'd wrought in glass ;  
In pearls and rubies rich the hawthorns show,  
While through the ice the crimson berries glow.  
The thick-sprung reeds, which watery marshes yield,  
Seem'd polish'd lances in a hostile field.  
The flag in limpid currents with surprise,  
Sees crystal branches on his forehead rise :  
The spreading oak, the beech, and tow'ring pine,  
Glaz'd over, in the freezing æther shine.  
The frighted birds the rattling branches shun,  
Which wave and glitter in the distant sun.

When if a sudden gust of wind arise,  
The brittle forest into atoms flies,  
The crackling woods beneath the tempest bends,  
And in a spangled shower the prospect ends :  
Or, if a southern gale the region warm,  
And by degrees unbend the wintry charm,  
The traveller a mry country fees,  
And journey sad beneath the dropping trees :  
Like some deluded peasant Merlin leads  
Through fragrant bow'rs and through delicious meads,  
While here enchanted gardens to him rise,  
And airy fabrics there attract his eyes,  
His wandering feet the magic paths pursue,  
And while he thinks the fair illusion true,  
The trackless scenes disperse in fluid air,  
And woods, and wilds, and thorny ways appear,  
A tedious road the weary wretch returns,  
And, as he goes, the transient vision mourns.

81. We have already observed that the essential, and indeed the true characteristic of epistolary writing is ease ; and on this account, as well as others, the following letter from Mr Pope to Miss Blount is to be admired.

*To Miss Blount, on her leaving the Town after the Coronation.*

As some fond virgin, whom her mother's care  
Drags from the town to wholesome country air ;  
Just when she learns to roll a melting eye,  
And hear a spark, yet think no danger nigh ;  
From the dear man unwilling she must sever,  
Yet takes one kiss before she parts for ever :  
Thus from the world fair Zephelinda flew,  
Saw others happy, and with sighs withdrew ;  
Not that their pleasures caus'd her discontent ;  
She sigh'd not that they stay'd, but that she went.  
She went, to plain-work, and to purling brooks,  
Old-fashion'd halls, dull aunts, and croaking rooks :  
She went from op'ra, park, assembly, play,  
To morning-walks, and pray'r's three hours a-day ;

To part her time 'twixt reading and bohea,  
To mule, and spill her solitary tea,  
Or o'er cold coffee trifle with the spoon,  
Count the slow clock, and dine exact at noon ;  
Divert her eyes with pictures in the fire,  
Hum half a tune, tell stories to the 'quire ;  
Up to her godly garret after seven,  
There starve and pray, for that's the way to heav'n.  
Some 'quire, perhaps, you take delight to rack ;  
Whose game is whist, whose treat's a toast in sack ;  
Who visits with a gun, presents you birds,  
Then gives a smacking buff, and cries,—no words !  
Or with his hound comes howling from the stable,  
Makes love with nods, and knees beneath a table ;  
Whose laughs are hearty, tho' his jests are coarse,  
And loves you best of all things—but his horse.

In some fair ev'ning, on your elbow laid,  
You dream of triumphs in the rural shade ;  
In pensive thought recall the fancy'd scene,  
See coronations rise on every green ;  
Before you pass th' imaginary lights  
Of lords and earls, and dukes, and garter'd knights,  
While the spread fan o'er-shades your closing eyes ;  
Then give one flirt, and all the vision flies.  
Thus vanish sceptres, coronets and balls,  
And leave you in lone woods, or empty walls !

So when your slave, at some dear idle time,  
(Not plagu'd with head-achs, or the want of rhyme)  
Stands in the streets, abstracted from the crew,  
And while he seems to study, thinks of you ;  
Just when his fancy points your sprightly eyes,  
Or sees the blush of soft Parthenia rise,  
Gay pats my shoulder, and you vanish quite,  
Streets, chairs, and coxcombs, rush upon my sight ;  
Vex'd to be still in town, I knit my brow,  
Look sour, and hum a tune, as you may now.

### SECT. VII. Of Descriptive Poetry.

82. DESCRIPTIVE poetry is of universal use, since there is nothing in nature but what may be described. As poems of this kind, however, are intended more to delight than to instruct, great care should be taken to make them agreeable. Descriptive poems are made beautiful by similes properly induced, images of feigned persons, and allusions to ancient fables or historical facts ; as will appear by a perusal of the best of these poems, especially Milton's *L' Allegro and Il Penseroso*, Denham's *Cooper Hill*, and Pope's *Windsor Forest*. Every body being in possession of Milton's works, we forbear inserting the two former ; and the others are two long for our purpose. That inimitable poem, *The Seasons*, by Mr Thomson, notwithstanding some parts of it are didactic, may be also with propriety referred to this head.

### SECT. VIII. Of Allegorical Poetry.

83. COULD truth engage the affections of mankind in her native and simple dress, the would require no ornament, or aid, from the imagination ; but her delicate light, though lovely in itself, and dear to the most discerning, does not strike the senses of the multitude so as to secure their esteem and attention : the poet therefore dressed her up in the manner in which  
they

*Allegorical.* they thought she would appear the most amiable, and called in allegories and airy disguises as her auxiliaries in the cause of virtue.

An allegory is a fable, or story, in which, under the disguise of imaginary persons or things, some real action or instructive moral is conveyed to the mind. Every allegory therefore has two senses, the one literal and the other mythical; the first has been aptly enough compared to a dream, or vision, of which the last is the true meaning or interpretation.

From this definition of allegorical poetry the reader will perceive that it gives great latitude to genius, and affords such a boundless scope for invention, that the poet is allowed to soar beyond all creation; to give life and action to virtues, vices, passions, diseases, and natural and moral qualities; to raise floating islands, enchanted palaces, castles, &c. and to people them with the creatures of his own imagination.

The poet's eye, in a fine frenzy rolling,  
Doth glance from heav'n to earth, from earth to heav'n;  
And, as imagination bodies forth  
The forms of things unknown, the poet's pen  
Turns them to shape, and gives to airy nothing  
A local habitation and a name.

SHAKESPEARE.

But whatever is thus raised by the magic of his mind must be visionary and typical, and the mythical sense appear obvious to the reader, and inculcate some moral or useful lesson in life; otherwise the whole will be deemed rather the effects of a disordered brain, than the productions of real wit and genius. The poet, like Jafon, may fail to parts unexplored, but will meet with no applause if he returns without a golden fleece; for these romantic reveries would be unpardonable but for the mythical meaning and moral that is thus artfully and agreeably conveyed with them, and on which account only the allegory is indulged with a greater liberty than any other sort of writing.

The ancients justly considered this sort of allegory as the most essential part of poetry; for the power of raising images of things not in being, giving them a sort of life and action, and presenting them, as it were, before the eyes, was thought to have something in it like creation: but then, in such compositions, they always expected to find a meaning couched under them of consequence; and we may reasonably conclude, that the allegories of their poets would never have been handed down to us, had they been deficient in this respect.

84. As the *fable* is the part immediately offered to the reader's consideration, and intended as an agreeable vehicle to convey the moral, it ought to be bold, lively, and surprising, that it may excite curiosity and support attention; for if the fable be spiritless and barren of invention, the attention will be disengaged, and the moral, however useful and important in itself, will be little regarded.

There must likewise be a justness and propriety in the fable, that is, it must be closely connected with the subject on which it is employed; for notwithstanding the boundless compass allowed the imagination in these writings, nothing absurd, or useless, is to be introduced. In epic poetry some things may perhaps be admitted for no other reason but to surprize, and to raise what is called the *wonderful*, which is as ne-

cessary to the epic as the *probable*; but in allegories, however wild and extravagant the fable and the persons introduced, each must correspond with the subject they are applied to, and, like the members of a well-written simile, bear a due proportion and relation to each other: for we are to consider, that the allegory is a sort of extended or rather multiplied simile, and therefore, like that, should never lose the subject it is intended to illustrate. Whence it will appear, that genius and fancy are here insufficient without the aid of taste and judgment: these first, indeed, may produce a multitude of ornaments, a wilderness of sweets; but the last must be employed to accommodate them to reason, and to arrange them so as to produce pleasure and profit.

But it is not sufficient that the fable be correspondent with the subject, and have the properties above-described; for it must also be consistent with itself. The poet may invent what story he pleases, and form any imaginary beings that his fancy shall suggest; but here, as in dramatic writings, when persons are once introduced, they must be supported to the end, and all speak and act in character: for notwithstanding the general licence here allowed, some order must be observed; and however wild and extravagant the characters, they should not be absurd. To this let me add, that the whole must be clear and intelligible; for the "fable (as Mr Hughes observes) being designed only to clothe and adorn the moral, but not to hide it, should resemble the draperies we admire in some of the ancient statues, in which the folds are not too many nor too thick, but so judiciously ordered, that the shape and beauty of the limbs may be seen through them."—But this will more obviously appear from a perusal of the best compositions of this class; such as Spenser's *Fairy Queen*, Thomson's *Castle of Indolence*, Addison and Johnson's beautiful allegories in the *Spectator* and *Rambler*, &c. &c.

85. The word *allegory* has been used in a more extensive sense than that in which we have here applied it: for all writings, where the moral is conveyed under the cover of borrowed characters and actions, by which other characters and actions (that are real) are represented, have obtained the name of *allegories*; though the fable or story contains nothing that is visionary or romantic, but is made up of real or historical persons, and of actions either probable or possible. But these writings should undoubtedly be distinguished by some other name, because the literal sense is consistent with right reason, and may convey an useful moral, and satisfy the reader, without putting him under the necessity of seeking for another.

Some of the ancient critics, as Mr Addison observes, were fond of giving the works of their poets this second or concealed meaning, though there was no apparent necessity for the attempt, and often but little show of reason in the application. Thus the *Iliad* and *Odyssey* of Homer are said to be fables of this kind, and that the gods and heroes introduced are only the affections of the mind represented in a visible shape and character. They tell us, says he, that Achilles in the first *Iliad* represents anger, or the irascible part of human nature: that upon drawing his sword against his superior, in a full assembly, Pallas (which, say they, is another name for reason) checks and advises him

allegorical him on the occasion, and, at her first appearance, touches him upon the head; that part of the man being looked upon as the seat of reason. In this sense, as Mr Hughes has well observed, the whole *Æneis* of Virgil may be said to be an allegory, if you suppose *Æneas* to represent Augustus Cæsar, and that his conducting the remains of his countrymen from the ruins of Troy, to a new settlement in Italy, is an emblem of Augustus's forming a new government out of the ruins of the aristocracy, and establishing the Romans, after the confusion of the civil war, in a peaceable and flourishing condition. However ingenious this coincidence may appear, and whatever design Virgil had in view, he has avoided a particular and direct application, and so conducted his poem, that it is perfect without any allegorical interpretation; for whether we consider *Æneas* or Augustus as the hero, the morals contained are equally instructive. And indeed it seems absurd to suppose, that because the epic poets have introduced some allegories into their works, every thing is to be understood in a mythical manner, where the sense is plain and evident without any such application. Nor is the attempt that Tasso made to turn his Jerusalem into a mystery, any particular recommendation of the work: for notwithstanding he tells us, in what is called the *allegory*, printed with it, that the Christian army represents man, the city of Jerusalem civil happiness, Godfrey the understanding, Rinaldo and Tancred the other powers of the soul, and that the body is typified by the common soldiers, and the like; yet the reader will find himself as little delighted as edified by the explication: for the mind has little pleasure in an allegory that cannot be opened without a key made by the hand of the same artist; and indeed every allegory that is so dark, and, as it were, inexplicable, loses its very essence, and becomes an enigma, or riddle, that is left to be interpreted by every crude imagination.

This last species of writing, whether called an *allegory*, or by any other name, is not less eminent and useful; for the introducing of real or historical persons may not abridge or lessen either our entertainment or instruction. In these compositions we often meet with an uncommon moral conveyed by the fable in a new and entertaining manner; or with a known truth forcefully decorated, and placed in such a new and beautiful light, that we are amazed how any thing so charming and useful should so long have escaped our observation. Such, for example, are many of Johnson's pieces published in the Rambler under the title of *Eastern Stories*, and by Hawkeſworth in the *Advertiser*.

The ancient parables are of this species of writing: and it is to be observed, that those in the New Testament have a most remarkable elegance and propriety; and are the more striking, and the more instructive, for being drawn from objects that are familiar.—The more striking, because, as the things are seen, the moral conveyed becomes the object of our senses, and requires little or no reflection.—the more instructive, because every time they are seen, the memory is awakened, and the same moral is again exhibited with pleasure to the mind, and accustoms it to reason and dwell on the subject. So that this method of instruction improves nature, as it were, into a book of life;

since every thing before us may be so managed, as to give lessons for our advantage. Our Saviour's parables of the sower and the seed, of the tares, of the mustard-seed, and of the leaven (*Matthew xiii.*), are all of this kind, and were obviously taken from the harvest just ripening before him; for his disciples plucked the ears of corn and did eat, rubbing them in their hands. See the articles *ALLEGORY*, and *METAPHOR* and *Allegory*, in the general alphabet.

#### SECT. VIII. Of Fables.

1. No method of instruction has been more ancient, more universal, and probably none more effectual, than that by apologue or fable. In the first ages, amongst a rude and fierce people, this perhaps was the only method that would have been borne; and even since the progress of learning has furnished other helps, the fable, which at first was used through necessity, is retained from choice, on account of the elegant happiness of its manner, and the refined address with which, when well conducted, it insinuates its moral.

2. As to the actors in this little drama, the fabulist has authority to press into his service every kind of existence under heaven; not only beasts, birds, insects, and all the animal creation; but flowers, shrubs, trees, and all the tribe of vegetables. Even mountains, fossils, minerals, and the inanimate works of nature, discourse articulately at his command, and act the part which he assigns them. The virtues, vices, and every property of beings, receive from him a local habitation and a name. In short, he may personify, bestow life, speech, and action, on whatever he thinks proper.

It is easy to imagine what a source of novelty and variety this must open to a genius capable of conceiving and of employing these ideal persons in a proper manner: what an opportunity it affords him to diversify his images, and to treat the fancy with changes of objects, while he strengthens the understanding, or regulates the passions, by a succession of truths. To raise beings like these into a state of action and intelligence, gives the fabulist an undoubted claim to that first character of the poet, a *creator*.

When these persons are once raised, we must carefully enjoin them proper tasks, and assign them sentiments and language suitable to their several natures and respective properties. A raven should not be extolled for her voice, nor a bear be represented with an elegant shape. It were a very obvious instance of absurdity, to paint a hare cruel, or a wolf compassionate. An ass were but ill qualified to be general of an army, though he may well enough serve, perhaps, for one of the trumpeters. But so long as popular opinion allows to the lion magnanimity, rage to the tiger, strength to the mule, cunning to the fox, and buffoonery to the monkey; why may not they support the characters of an Agamemnon, Achilles, Ajax, Ulysses, and Thersites? The truth is, when moral actions are with judgment attributed to the brute creation, we scarce perceive that nature is at all violated by the fabulist. He appears at most to have only translated their language. His lions, wolves, and foxes, behave and argue as those creatures would, had they originally been endowed with the human faculties of speech and reason.

But greater art is yet required whenever we personify inanimate beings. Here the copy so far deviates from the great lines of nature, that, without the nicest care, reason will revolt against the fiction. However, beings of this sort, managed ingeniously and with address, recommend the fabulist's invention by the grace of novelty and of variety. Indeed the analogy between things natural and artificial, animate and inanimate, is often so very striking, that we can, with seeming propriety, give passions and sentiments to every individual part of existence. Appearance favours the deception. The vine may be enamoured of the elm; her embraces testify her passion. The swelling mountain may, naturally enough, be delivered of a mouse. The gourd may reproach the pine, and the sky-rocket insult the stars. The axe may solicit a new handle of the forest; and the moon, in her female character, request a fashionable garment. Here is nothing incongruous; nothing that shocks the reader with impropriety. On the other hand, were the axe to desire a periwig, and the moon petition for a new pair of boots, probability would then be violated, and the absurdity become too glaring.

3. The most beautiful fables that ever were invented, may be disguised by the language in which they are clothed. Of this poor *Ætop*, in some of his English dresses, affords a melancholy proof. The ordinary style of fable should be familiar, but also elegant.

The familiar, says Mr La Motte, is the general tone or accent of fable. It was thought sufficient, on its first appearance, to lend the animals our most common language. Nor indeed have they any extraordinary pretensions to the sublime; it being requisite they should speak with the same simplicity that they behave.

The familiar also is more proper for insinuation than the elevated; this being the language of reflection, as the former is the voice of sentiment. We guard ourselves against the one, but lie open to the other; and instruction will always the most effectually sway us, when it appears least jealous of its rights and privileges.

The familiar style, however, that is here required, notwithstanding that appearance of ease which is its character, is perhaps more difficult to write than the more elevated or sublime. A writer more readily perceives when he has risen above the common language, than he perceives, in speaking this language, whether he has made the choice that is most suitable to the occasion: and it is, nevertheless, upon this happy choice depends all the charms of the familiar. Moreover, the elevated style deceives and seduces, although it be not the best chosen; whereas the familiar can procure itself no sort of respect, if it be not easy, natural, just, delicate, and unaffected. A fabulist must therefore bestow great attention upon his style; and even labour it so much the more, that it may appear to have cost him no pains at all.

The authority of Fontaine justify these opinions in regard to style. His fables are perhaps the best examples of the genteel familiar, as Sir Roger L'Étrange affords the grossest of the indelicate and low. When we read, that "while the frog and the mouse were disputing it at sword-point, down comes a kite powdering upon them in the interim, and gobblets up both

together to part the fray." And "where the fox reproaches a bevy of jolly gossiping wenches making merry over a dish of pullets, that if he but peeped into a hen-roost, they always made a bawling with their dogs and their bastards; while you yourselves (says he) can lie stuffing your guts with your hens and capons, and not a word of the pudding." This may be familiar; but it is also coarse and vulgar, and cannot fail to disgust a reader that has the least degree of taste or delicacy.

The style of fable then must be simple and familiar; and it must likewise be correct and elegant. By the former, we mean, that it should not be loaded with figure and metaphor; that the disposition of words be natural, the turn of sentences easy, and their construction unembarrassed. By elegance, we would exclude all coarse and provincial terms; all affected and peurile conceits; all obsolete and pedantic phrases. To this we would adjoin, as the word perhaps implies, a certain finishing polish, which gives a grace and spirit to the whole; and which, though it have always the appearance of nature, is almost ever the effect of art.

But notwithstanding all that has been said, there are some occasions on which it is allowable, and even expedient, to change the style. The language of a fable must rise or fall in conformity to the subject. A lion, when introduced in his regal capacity, must hold discourse in a strain somewhat more elevated than a country-mouse. The lioness then becomes his queen, and the beasts of the forest are called his subjects: a method that offers at once to the imagination both the animal and the person he is designed to represent. Again, the buffoon-monkey should avoid that pomp of phrase, which the owl employs as her best pretence to wisdom. Unless the style be thus judiciously varied, it will be impossible to preserve a just distinction of character.

Descriptions, at once concise and pertinent, add a grace to fable; but are then most happy when included in the action: whereof the fable of Boreas and the Sun affords us an example. An epithet well chosen is often a description in itself; and so much the more agreeable, as it the less retards us in our pursuit of the catastrophe.

Lastly, little strokes of humour when arising naturally from the subject, and incidental reflections when kept in due subordination to the principal, add a value to these compositions. These latter, however, should be employed very sparingly, and with great address; be very few, and very short: it is scarcely enough that they naturally spring out of the subject; they should be such as to appear necessary and essential parts of the fable. And when these embellishments, pleasing in themselves, tend to illustrate the main action, they then afford that nameless grace remarkable in Fontaine and some few others, and which persons of the best discernment will more easily conceive than they can explain.

#### SECT. IX. Of Satire.

88. THIS kind of poem is of very ancient date, and (if we believe Horace) was introduced, by way of interlude, by the Greek dramatic poets in their tragedies, to relieve the audience, and take off the force

Satire.

Satire.

force of those strokes which they thought too deep and affecting. In those satirical interludes, the scene was laid in the country; and the persons were rural deities, satyrs, country peasants, and other rustics.

The first Tragedians found that serious style Too grave for their uncultivated age,  
And lo brought wild and naked Satyrs in,  
(Whose motion, words, and shape, were all a farce)  
As oft as decency wou'd give them leave;  
Because the mad, ungovernable rout,  
Full of confusion and the fumes of wine,  
Lov'd such variety and antic tricks.

RosCOMMON'S *Horace*.

The satire we now have is generally allowed to be of Roman invention. It was first introduced without the decorations of scenes and action; but written in verses of different measures by Ennius, and afterwards moulded into the form we now have it by Lucilius, whom Horace has imitated, and mentions with esteem. This is the opinion of most of the critics, and particularly of Boileau, who says,

Lucilius led the way, and, bravely bold,  
To Roman vices did the mirror hold;  
Protected humble goodness from reproach,  
Show'd worth on foot, and rascals in a coach.  
Horace his pleasing wit to this did add,  
That none, unenfur'd, might be fools or mad:  
And Juvenal, with rhetorician's rage,  
Scourg'd the rank vices of a wicked age;  
Tho' horrid truths thro' all his labours shine,  
In what he writes there's something of divine.

89. Our satire, therefore, may be distinguished into two kinds; the *jocose*, or that which makes sport with vice and folly, and sets them up to ridicule; and the *serious*, or that which deals in asperity, and is severe and acrimonious. Horace is a perfect master of the first, and Juvenal much admired for the last. The one is facetious, and smiles: the other is angry, and storms. The foibles of mankind are the object of one; but crimes of a deeper dye have engaged the other. They both agree, however, in being pungent and biting: and from a due consideration of the writings of these authors, who are our masters in this art, we may define satire to be, A free, (and often jocose), witty, and sharp poem, wherein the follies and vices of men are lash'd and ridiculed in order to their reformation. Its subject is whatever deserves our contempt or abhorrence, (including every thing that is ridiculous and absurd, or scandalous and repugnant to the golden precepts of religion and virtue.) Its manner is *invective*; and its end, *shame*. So that satire may be looked upon as the physician of a diltmper'd mind, which it endeavours to cure by bitter and unfavoury, or by pleasant and salutary applications.

90. A good satirist ought to be a man of wit and address, sagacity and eloquence. He should also have a great deal of good-nature, as all the sentiments which are beautiful in this way of writing must proceed from that quality in the author. It is good-nature produces that disdain of all baseness, vice, and folly, which prompts the poet to express himself with such smartness against the errors of men, but without bitterness to their persons. It is this quality that keeps

VOL. VIII

2

the mind even; and never lets an offence unseasonably throw the satirist out of his character.

61. In writing satire, care should be taken that it be true and general; that is, levelled at abuses in which numbers are concerned: for the personal kind of satire, or lampoon, which exposes particular characters, and affects the reputation of those at whom it is pointed, is scarce to be distinguished from scandal and defamation. The poet also, whilst he is endeavouring to correct the guilty, must take care not to use such expressions as may corrupt the innocent: he must therefore avoid all obscene words, and images that tend to debase and mislead the mind. Horace and Juvenal, the chief satirists among the Romans, are faulty in this respect, and ought to be read with caution.

92. The style proper for satire is sometimes grave and animated, inveighing against vice with warmth and earnestness; but that which is pleasant, sportive, and, with becoming raillery, bansters men out of their bad dispositions, has generally the best effect, as it seems only to play with their follies, though it omits no opportunity of making them feel the lash. The verses should be smooth and flowing, and the language manly, just, and decent.

Of well-chose words some take not care enough,  
And think they should be as the subject rough:  
But satire must be more exactly made,  
And sharpest thoughts in smoothest words convey'd.

Duke of Buck's *Essay*.

93. Satires, either of the *jocose* or *serious* kind, may be written in the epistolary manner, or by way of dialogue. Horace, Juvenal, and Persius, have given us examples of both. Nay, some of Horace's satires may, without incongruity, be called *epistles*, and his epistles *satires*. But this is obvious to every reader.

Of the facetious kind, the second satire of the second book of Horace imitated by Mr Pope, and Swift's verses on his own death, may be referred to as examples.

As to those satires of the serious kind, for which Juvenal is so much distinguished, the characteristic properties of which are, morality, dignity, and severity; a better example cannot be mentioned than a poem entitled *London*, written in imitation of the third satire of Juvenal, by Mr Samuel Johnson, who has kept up to the spirit and force of the original.

Nor must we omit to mention Dr Young's *Love of Fame the Universal Passion*, in seven satires; which, though characteristic, abound with morality and good sense. The characters are well selected, the ridicule is high, and the satire well pointed and to the purpose.

94. We have already observed, that personal satire approaches too near defamation, to deserve any countenance or encouragement. Dryden's *Mack Flecknoe* is for this reason exceptionable, but as a composition it is inimitable.

We have dwelt thus long on the present subject, because there is reason to apprehend, that the benefits arising from well-conducted satire have not been sufficiently considered. A satire may often do more service to the cause of religion and virtue, than a sermon; since it gives pleasure, at the same time that it creates

35 P

fear

fear or indignation, and conveys its sentiments in a manner the most likely to captivate the mind.

Of all the ways that wise men could find  
To mend the age and mortify mankind,  
Satire well writ has most successful prov'd,  
And cures, because the remedy is lov'd.

Duke of Bucks's Essay.

But to produce the desired effect, it must be jocose, free, and impartial, though severe. The satirist should always preserve good-humour; and, however keen he cuts, should cut with kindness. When he loses temper, his weapons will be inverted, and the ridicule he threw at others will retort with contempt upon himself: for the reader will perceive that he is angry and hurt, and consider his satire as the effect of malice, not of judgment; and that it is intended rather to wound serious, than reform manners.

Rage you must hide, and prejudice lay down:  
A satyr's smile is sharper than his frown.

The best, and indeed the only method to expose vice and folly effectually, is to turn them to ridicule, and hold them up for public contempt; and as it most offends these objects of satire, so it least hurts ourselves. One passion frequently drives out another; and as we cannot look with indifference on the bad actions of men (for they must excite either our wrath or contempt), it is prudent to give way to that which most offends vice and folly, and least affects ourselves; and to sneer and laugh, rather than be angry and scold.

95. Burlesque poetry, which is chiefly used by way of drollery and ridicule, falls properly to be spoken of under the head of satire. An excellent example of this kind is a poem in blank verse, intitled *The Splendid Shilling*, written by Mr John Philips, which, in the opinion of one of the best judges of the age, is the finest burlesque in the English language. In this poem the author has handled a low subject in the lofty style and numbers of Milton; in which way of writing Mr Philips has been imitated by several, but none have come up to the humour and happy turn of the original. When we read it, we are betrayed into a pleasure that we could not expect; though, at the same time, the sublimity of the style, and gravity of the phrase, seem to chastise that laughter which they provoke.

96. There is another sort of verse and style, which is most frequently made use of in treating any subject in a ludicrous manner, viz. that which is generally called *Hudibrastic*, from Butler's admirable poem intitled *Hudibras*. Almost every one knows, that this poem is a satire upon the authors of our civil dissensions in the reign of king Charles I. wherein the poet has, with abundance of wit and humour, exposed and ridiculed the hypocrisy or blind zeal of those unhappy times. In short, it is a kind of burlesque epic poem, which, for the oddity of the rhymes, the quaintness of the similes, the novelty of the thoughts, and that fine raillery which runs through the whole performance, is not to be paralleled.

#### SECT. X. Of the Epigram.

97. The epigram is a little poem, or composition in verse, treating of one thing only, and whose distinguishing characters are brevity, beauty, and point.

The word *epigram* signifies "inscription;" for epigrams derive their origin from those inscriptions placed by the ancients on their statues, temples, pillars, triumphal arches, and the like; which, at first, were very short, being sometimes no more than a single word; but afterwards, increasing their length, they made them in verse, to be the better retained by the memory. This short way of writing came at last to be used upon any occasion or subject; and hence the name of *epigram* has been given to any little copy of verses, without regard to the original application of such poems.

Its usual limits are from 2 to 20 verses, though sometimes it extends to 50; but the shorter, the better it is, and the more perfect, as it partakes more of the nature and character of this kind of poem: besides, the epigram, being only a single thought, ought to be expressed in a little compass, or else it loses its force and strength.

The beauty required in an epigram is an harmony and apt agreement of all its parts, a sweet simplicity, and polite language.

The point is a sharp, lively, unexpected turn of wit, with which an epigram ought to be concluded. There are some critics, indeed, who will not admit the point in an epigram; but require that the thought be equally diffused through the whole poem, which is usually the practice of Catullus, as the former is that of Martial. It is allowed there is more delicacy in the manner of Catullus; but the point is more agreeable to the general taste, and seems to be the chief characteristic of the epigram.

This sort of poem admits of all manner of subjects, provided that brevity, beauty, and point are preferred; but it is generally employed either in praise or satire.

Though the best epigrams are said to be such as are comprised in two or four verses, we are not to understand it as if none can be perfect which exceed those limits. Neither the ancients nor moderns have been so scrupulous with respect to the length of their epigrams; but however, brevity in general is always to be studied in these compositions.

For examples of good epigrams in the English language, we shall make choice of several in the different tastes we have mentioned; some remarkable for their delicate turn and simplicity of expression; and others for their salt and sharpness, their equivocating pun, or pleasant allusion. In the first place, take that of Mr Pope, said to be written on a glass with the earl of Chesterfield's diamond-pencil.

Accept a miracle, instead of wit;

See two dull lines by Stanhope's pencil writ.

The beauty of this epigram is more easily seen than described; and it is difficult to determine, whether it does more honour to the poet who wrote it, or to the nobleman for whom the compliment is designed.—The following epigram of Mr Prior is written in the same taste, being a fine encomium on the performance of an excellent painter.

On a Flower, painted by VARELST.

When sam'd Varelst this little wonder drew,  
Flora vouchsaf'd the growing work to view:

Finding

Finding the painter's science at a stand,  
The Goddeſs ſnatch'd the pencil from his hand,  
And, finiſhing the piece, the ſmiling ſaid,  
*Behold one work of mine which ne'er ſhall fade.*

Another compliment of this delicate kind he has made Mr Howard in the following epigram.

V E N U S Miſtaken.

When Chloe's picture was to Venus ſhown;  
Surpriz'd, the Goddeſs took it for her own.  
And what, ſaid ſhe, does this bold painter mean?  
When was I bathing thus, and naked ſeen?  
Pleas'd Cupid heard, and check'd his mother's pride:  
And who's blind now, mamma? the urchin cry'd.  
'Tis Chloe's eye, and cheek, and lip, and breaſt:  
Friend Howard's genius fancy'd all the reſt.

Moſt of Mr Prior's epigrams are of this delicate caſt, and have the thought, like thoſe of Catallus, diffuſed through the whole. Of this kind is his addreſs

To C H L O E Weeping.

See, whiſt thou weep'ſt, fair Chloe, ſee  
The world in ſympathy with thee.  
The cheerful birds no longer ſing,  
Each drops his head, and hangs his wing.  
The clouds have bent their boſom lower,  
And ſhed their ſorrow in a ſhower.  
The brooks beyond their limits flow,  
And louder murmurs ſpeak their woe:  
The nymphs and ſwains adopt thy cares;  
They heave thy ſighs, and weep thy tears.  
Fantatic nymph! that grief ſhould move  
Thy heart obdurate againſt love.  
Strange tears! whoſe pow'r can ſoften all,  
But that dear breaſt on which they fall.

The epigram written on the leaves of a fan by Dr Atterbury, late biſhop of Rochelter, contains a pretty thought, expreſſed with eaſe and conciſeneſs, and cloſed in a beautiful manner.

O n a F A N.

Flavia the leaſt and ſlighteſt toy  
Can with reſiſtleſs art employ.  
This fan in meaner hands would prove  
An engine of ſmall force in love:  
Yet ſhe, with graceful air and mien,  
Not to be told or ſafely ſeen,  
Direcſts his wanton motion ſo,  
That it wounds more than Cupid's bow,  
Gives coolneſs to the matchleſs dame,  
To ev'ry other breaſt a flame.

We ſhall now ſelect ſome epigrams of the biting and ſatirical kind, and ſuch as turn upon the *pun* or *equivoque*, as the French call it: in which fort the point is more conſpicuous than in thoſe of the former character.

The following diſtich is an admirable epigram, having all the neceſſary qualities of one, eſpecially point and brevity.

O n a Company of bad DANCERS to good Muſic.

How ill the motion with the muſic ſuits!  
So Orpheus fiddled, and ſo danc'd the brutes.

This brings to mind another epigram upon a bad fiddler, which we ſhall venture to inſert merely for the humour of it, and not for any real excellence it contains.

To a Bad FIDDLER.

Old Orpheus play'd ſo well, he mov'd Old Nick;  
But thou mov'ſt nothing but thy fiddle-ſtick.

One of Martial's epigrams, wherein he agreeably rallies the fooliſh vanity of a man who hired people to make verſes for him, and publiſhed them as his own, has been thus tranſlated into Engliſh:

Paul ſo fond of the name of a poet is grown,  
With gold he buys verſes, and calls them his own.  
Go on, maſter Paul, nor mind what the world ſays,  
They are ſurely his own for which a man pays.

Some bad writer having taken the liberty to cenſure Mr Prior, the poet very wittily laſhed his impertinence in this epigram:

While faſter than his coſtive brain indites,  
Philo's quick hand in flowing letters writes,  
His caſe appears to me like honeſt Teague's,  
When he was run away with by his legs.  
Phœbus, give Philo o'er himſelf command;  
Quicken his ſenſes, or reſtrain his hand:  
Let him be kept from paper, pen, and ink;  
So he may ceaſe to write, and learn to think.

Mr Weſley has given us a pretty epigram, alluding to a well-known text of ſcripture, on the ſetting up a monument in Weſtmiſter Abbey, to the memory of the ingenious Mr Butler, author of *Hudibras*.

While Butler, needy wretch, was yet alive,  
No generous patron would a dinner give.  
See him when ſtarv'd to death, and turn'd to duſt,  
Preſented with a monumental buſt!  
The poet's fate is here in emblem ſhown;  
He ask'd for Bread, and he receiv'd a Stone.

We ſhall cloſe this ſection with an epigram written on the well-known ſtory of Apollo and Daphne, by Mr Smart.

When Phœbus was am'rous and long'd to be rude,  
Miſs Daphne cry'd Fiſh! and ran ſwift to the wood;  
And rather than do ſuch a naughty affair,  
She became a fine laurel to deck the god's hair.  
The nymph was, no doubt, of a cold conſtitution;  
For, ſure, to turn tree was an odd reſolution!  
Yet in this ſhe behav'd like a true modern ſpouſe,  
For ſhe fled from his arms to diſtinguiſh his brows.

SECT. XI. Of the Epitaph.

102. THESE compositions generally contain ſome eulogium of the virtues and good qualities of the deceaſed, and have a turn of ſeriousneſs and gravity adapted to the nature of the ſubject. Their elegance conſiſts in a nervous and expreſſive brevity; and ſometimes they are cloſed with an epigrammatic point. In theſe compositions, no mere epithet (properly ſo called) ſhould be admitted; for here illuſtration would impair the ſtrength, and render the ſentiment too diſſuſe and languid. Words that are fynonymous are alſo to be reſected.

Though the true characteristic of the epitaph is seriousness and gravity, yet we may find many that are jocose and ludicrous: some likewise have true metre and rhyme; while others are between prose and verse, without any certain measure, though the words are truly poetical; and the beauty of this last sort is generally heightened by an apt and judicious antithesis. We shall give examples of each.

The following epitaph on Sir Philip Sidney's sister, the Countess of Pembroke, said to be written by the famous Ben Johnson, is remarkable for the noble thought with which it concludes.

*On MARY Countess's dowager of PEMBROKE.*

Underneath this noble marble hearse,  
Lies the subject of all verse,  
Sidney's sister, Pembroke's mother:  
Death, ere thou hast kill'd another  
Fair, and learn'd, and good as she,  
Time shall throw a dart at thee.

Take another epitaph of Ben Johnson's, on a beautiful and virtuous lady, which has been deservedly admired by very good judges.

Underneath this stone doth lie  
As much virtue as could die;  
Which when alive did vigour give  
To as much beauty as could live!

Mr Pope has drawn the character of Mr Gay, in an epitaph now to be seen on his monument in Westminster-abbey, which he has closed with a most beautiful turn, and is looked upon as a master-piece of its kind, as indeed are most of the productions of that surprising genius.

*On Mr GAY.*

Of manners gentle, of affections mild;  
In wit, a man; simplicity, a child:  
With native humour temp'ring virtuous rage,  
Form'd to delight at once, and last the age:  
Above temptation in a low estate,  
And uncorrupted ev'n among the great:  
A safe companion, and an easy friend,  
Unblam'd thro' life, lamented in thy end.  
These are thy honours! not that here thy bust  
Is mix'd with heroes, or with kings thy dust;  
But that the worthy and the good shall say,  
Striking their pensive bosoms—Here lies GAY.

Amongst the epitaphs of a punning and ludicrous cast, we know of none prettier than that which is said to have been written by Mr Prior on himself, wherein he is pleasantly satirical upon the folly of those who value themselves on account of the long series of ancestors through which they can trace their pedigree.

Nobles and heralds, by your leave,  
Here lies the bones of Matthew Prior,  
The son of Adam and of Eve:  
Let Bourbon or Nassau go higher.

The following epitaph on a miser contains a good caution and an agreeable rallery.

Reader, beware immoderate love of pelf:  
Here lies the worst of thieves, who robb'd himself.

But Dr Swift's epitaph on the same subject is a master-piece of the kind.

Beneath this verdant hillock lies  
Demer, the wealthy and the wise,  
His heirs, that he might safely rest,  
Have put his carcase in a chest:  
The very chest, in which, they say,  
His other Self, his money, lay.  
And if his heirs continue kind  
To that dear self he left behind,  
I dare believe that four in five  
Will think his better half alive.

We shall give but one example more of this kind, which is a merry epitaph on an old fiddler, who was remarkable (we may suppose) for beating time to his own music.

*On STEPHEN the Fiddler.*

Stephen and time are now both even;  
Stephen beat time, now time's beat Stephen.

We are come now to that sort of epitaph which rejects rhyme, and has no certain and determinate measure; but where the diction must be pure and strong, every word have weight, and the antithesis be preferred in a clear and direct opposition. We cannot give a better example of this sort of epitaph, than that on the tomb of Mr Pultney in the cloisters of Westminster-abbey.

*Reader,*

If thou art a BRITON,  
Behold this Tomb with Reverence and Regret:  
Here lies the Remains of

DANIEL PULTENEY,

The kindest Relation, the truest Friend,  
The warmest Patriot, the worthiest Man.

He exercis'd Virtues in this Age,

Sufficient to have distinguish'd him even in the best.

Sagacious by Nature,

Industrious by Habit,

Inquisitive with Art;

He gain'd a complete Knowledge of the State of Britain,  
Foreign and domestic;

In most the backward Fruit of tedious Experience,  
In him the early acquisition of undissipated Youth.

He serv'd the Court several Years:

Aboard, in the auspicious Reign of Queen Anne;  
At home, in the reign of that excellent prince K. George I.

He serv'd his Country always,

At Court independent,

In the Senate unbias'd,

At every Age, and in every Station:

This was the bent of his generous Soul,

This the business of his laborious Life.

Public Men, and Public Things,

He judg'd by one constant Standard,

*The true Interest of Britain:*

He made no other Distinction of Party,

He abhorred all other.

Gentle, humane, disinterested, beneficent,  
He created no Enemies on his own Account:

Firm, determin'd, inflexible,

He feared none he could create in the Cause of Britain.

Reader,

Epitaph.

Reader,

In this Misfortune of thy Country lament thy own:

For know,

The Loss of so much private Virtue

Is a public Calamity.

That poignant satire, as well as extravagant praise, may be conveyed in this manner, will be seen by the following epitaph written by Dr Arbuthnot on Francis Chartres; which is too well known, and too much admired, to need our commendation.

HERE continueth to rot

The Body of FRANCIS CHARTRES,

Who with an INFLEXIBLE CONSTANCY,

And INIMITABLE UNIFORMITY of Life,

PERSISTED,

In spite of AGE and INFIRMITIES,

In the Practice of EVERY HUMAN VICE,

Excepting PRODIGALITY and HYPOCRISY:

His insatiable AVARICE exempted him from the first,

His matchless IMPUDENCE from the second.

Nor was he more singular

In the undeviating *Pravity* of his *Manners*,

Than successful

In *Accumulating WEALTH*:

For, without TRADE or PROFESSION,

Without TRUST of PUBLIC MONEY,

And without BRIDE-WORTHY Service,

He acquired, or more properly created,

A MINISTERIAL ESTATE.

He was the only Person of his Time

Who could CHEAT without the Mask of HONESTY,

Retain his Primæval MEANNESS

When possessed of TEN THOUSAND a-year;

And having daily deserved the GIBNET for what he *did*,Was at last condemn'd to it for what he *could not do*.

Oh indignant reader!

Think not his Life useless to Mankind;

PROVIDENCE conniv'd at his execrable designs,

To give to After-ages

A conspicuous PROOF and EXAMPLE,

Of how small Estimation is EXORBITANT WEALTH

In the Sight of GOD,

By His bestowing it on the most UNWORTHY of ALL MORTALS.

We shall conclude this species of poetry with a droll and satirical epitaph written by Mr Pope, which we transcribed from a monument in Lord Cobham's gardens at Stow in Buckinghamshire.

To the Memory

of

SIGNIOR FIDO,

An *Italian* of good extraction;Who came into *England*,

Not to bite us, like most of his Countrymen,

But to gain an honest Livelyhood.

He hunted not after Fame,

Yet acquir'd it;

Regardless of the Praise of his Friends,

but most sensible of their Love.

Tho' he liv'd among'th the Great,

He neither learnt nor flatter'd any Vice.

He was no Bigot,

Tho' he doubted of none of the 39 Articles.

And, if to follow Nature,

and to respect the Laws of Society,

be Philosophy,

he was a perfect Philosopher,

a faithful Friend,

an agreeable Companion,

a loving Husband,

distinguish'd by a numerous offspring,

all which he liv'd to see take good Courses.

In his old Age he retired

to the house of a clergyman in the country,

where he finish'd his earthly Race,

and died an Honour and an Example to the whole Species.

Reader,

This Stone is guiltless of Flattery;

for he to whom it is inscrib'd

was not a MAN,

but a

GRE-HOUND.

## PART III. ON VERSIFICATION.

ON this subject it is meant to confine our inquiry to Latin or Greek hexameters, and to French and English heroic verse; as the observations we shall have occasion to make, may, with proper variations, be easily transferred to the composition of other sorts of verse.

Before entering upon particulars, it must be premised in general, that to verse of every kind, five things are of importance. 1st, The number of syllables that compose a line. 2d, The different lengths of syllables, *i. e.* the difference of time taken in pronouncing. 3d, The arrangement of these syllables combined in words. 4th, The pauses or stops in pronouncing. 5th, Pronouncing syllables in a high or a low tone. The three first mentioned are obviously essential to verse: if any of them be wanting, there cannot be that higher degree of melody which distinguisheth verse from prose. To give a just notion of the fourth, it must be observed, that pauses are

necessary for three different purposes: one, to separate periods, and members of the same period, according to the sense: another, to improve the melody of verse: and the last, to afford opportunity for drawing breath in reading. A pause of the first kind is variable, being long or short, frequent or less frequent, as the sense requires. A pause of the second kind, being determined by the melody, is in no degree arbitrary. The last sort is in a measure arbitrary, depending on the reader's command of breath. But as one cannot read with grace, unless, for drawing breath, opportunity be taken of a pause in the sense or in the melody, this pause ought never to be distinguished from the others; and for that reason shall be laid aside. With respect then to the pauses of sense and of melody, it may be affirmed without hesitation, that their coincidence in verse is a capital beauty: but as it cannot be expected, in a long work especially, that every line should be so perfect; we shall afterward have occasion

occasion for, that the pause necessary for the sense must often, in some degree, be sacrificed to the verse-pause, and the latter sometimes to the former.

The pronouncing syllables in a high or low tone, contributes also to melody. In reading, whether verse or prose, a certain tone is assumed, which may be called the *key-note*; and in that tone the bulk of the words are founded. Sometimes to humour the sense, and sometimes the melody, a particular syllable is founded in a higher tone; and this is termed *accenting a syllable*, or gracing it with an accent. Opposed to the accent, is the cadence, which, however, being entirely regulated by the sense, hath no peculiar relation to verse. The cadence is a falling of the voice below the key-note at the close of every period; and so little is it essential to verse, that in correct reading the final syllable of every line is accented, that syllable only excepted which closes the period where the sense requires a cadence.

Though the five requisites above mentioned enter the composition of every species of verse, they are however governed by different rules, peculiar to each species. Upon quantity only, one general observation may be premised, because it is applicable to every species of verse. That syllables, with respect to the time taken in pronouncing, are long or short; two short syllables, with respect to time, being precisely equal to a long one. These two lengths are essential to verse of all kinds; and to no verse, it is believed, is a greater variety of time necessary in pronouncing syllables. The voice indeed is frequently made to rest longer than usual upon a word that bears an important signification; but this is done to humour the sense, and is not necessary for melody. A thing not more necessary for melody occurs with respect to accenting, similar to that now mentioned: A word signifying any thing humble, low, or dejected, is naturally, in prose as well as in verse, pronounced in a tone below the key-note.

We are now sufficiently prepared for particulars; beginning with Latin or Greek hexameter, which are the same. The observations upon this species of verse, will come under the four following heads, number, arrangement, pause, and accent; for as to quantity, what is observed above may suffice.

I. Hexameter lines, as to time, are all of the same length; being equivalent to the time taken in pronouncing twelve long syllables or twenty-four short. An hexameter line may consist of seventeen syllables: and when regular and not Spondaic, it never has fewer than thirteen: whence it follows, that where the syllables are many, the plurality must be short; where few, the plurality must be long.

This line is susceptible of much variety as to the succession of long and short syllables. It is however subjected to laws that confine its variety within certain limits: and for ascertaining these limits, grammarians have invented a rule by dactyles and spondaes, which they denominate *feet*. One at first view is led to think, that these feet are also intended to regulate the pronunciation: which is far from being the case; for were one to pronounce according to these feet, the melody of a hexameter line would be destroyed, or at best be much inferior to which it is when properly pronounced. These feet must be confined to regulate the

arrangement, for they serve no other purpose. They are withal extremely artificial and complex; for which reason we are obliged to lord Kames for substituting in their stead the following rules more simple and of more easy application. 1st, The line must always commence with a long syllable, and close with two long preceded by two short. 2d, More than two short can never be found together, nor fewer than two. And, 3d, Two long syllables which have been preceded by two short, cannot also be followed by two short. These few rules fulfil all the conditions of a hexameter line with relation to order or arrangement. To these again a single rule may be substituted, which has also the advantage of regulating more affirmatively the construction of every part. To put this rule into words with perspicuity, a hint is taken from the twelve long ch. xviii. syllables that compose an hexameter line, to divide it into twelve equal parts or portions, being each of them one long syllable or two short. The rule then is: "The 1st, 3d, 5th, 7th, 9th, 11th, and 12th portions, must each of them be one long syllable; the 10th must always be two short syllables; the 2d, 4th, 6th, and 8th, may either be one long or two short." Or to express the thing still more curly, "The 2d, 4th, 6th, and 8th portions may be one long syllable or two short; the 10th must be two short syllables; all the rest must consist each of one long syllable." This fulfils all the conditions of an hexameter line, and comprehends all the combinations of dactyles and spondaes that this line admits.

Next in order comes the pause. At the end of every hexameter line, every one must be sensible of a complete close or full pause; the cause of which follows. The two long syllables preceded by two short, which always close an hexameter line, are a fine preparation for a pause: for long syllables, or syllables pronounced slow, resembling a slow and languid motion tending to rest, naturally incline the mind to rest, or, which is the same, to pause; and to this inclination the two preceding short syllables contribute, which, by contrast, make the slow pronunciation of the final syllables the more conspicuous. Beside this complete close or full pause at the end, others are also requisite for the sake of melody: of which, two are clearly discoverable; and perhaps there may be more. The longest and most remarkable, succeeds the 5th portion: the other, which, being shorter and more faint, may be called the *semipauses*, succeeds the 8th portion. So striking is the pause first mentioned, as to be distinguished even by the rudest ear: the monkish rhymes are evidently built upon it; in which, by an invariable rule, the final word always chimes with that which immediately precedes the pause:

De planctu cudo || metrum cum carmine nudo  
Mingere cum bumbis || res est saluberrima lumbis.

The difference of time in the pause and semipauses, occasions another difference not less remarkable; that it is lawful to divide a word by a semipauses, but never by a pause, the bad effect of which is sensibly felt following examples:

Effusus labor, at||que inimitis rupta Tyranni  
Again:

Observans nido im||plumes detraxit; at illa

Again:

Elem. of  
Criticism,  
ch. xviii.  
sect. 4.

Again,  
Loricam quam De||moleo detraxerat ipse

The dividing a word by a semipaſſe has not the ſame bad effect:

Jamque pedem referens || caſus e | vaſerat omnes.

Again:

Qualis populea || mœrgns Philo|mela ſub umbra.

Again:

Ludere que vellem || calamo per | miſit agreſſi.

Lines, however, where words are left entire, without being divided even by a ſemipaſſe, run by that means much the more ſweetly.

Nec gemere aërea || ceſſabit | turtur ab ulmo.

Again:

Quadrupedante putrem||ſonitu quatit ungula campum.

Again:

Eurydicen toto || reſerebant | flumine ripæ.

The reaſon of theſe obſervations will be evident upon the ſlighteſt reflection. Between things ſo intimately connected in reading aloud, as are ſenſe and ſound, every degree of diſcord is unpleaſant: and for that reaſon, it is a matter of importance, to make the muſical pauſes coincide as much as poſſible with thoſe of ſenſe; which is requiſite, more eſpecially, with reſpect to the pauſe, a deviation from the rule being leſs remarkable in a ſemipaſſe. Conſidering the matter as to melody ſoldy, it is indifferent whether the pauſes be at the end of words or in the middle; but when we carry the ſenſe along, it is diſagreeable to find a word ſplit into two by a pauſe, as if there were really two words; and though the diſagreeableneſs here be connected with the ſenſe only, it is by an eaſy tranſition of perceptions tranſferred to the ſound; by which means we conceive a line to be harſh and grating to the ear, when in reality it is only ſo to the underſtanding.

To the rule that fixes the pauſe after the 5th portion, there is one exception, and no more. If the ſyllable ſucceeding the 5th portion be ſhort, the pauſe is ſometimes poſtponed to it:

Papillis quos dura || premit cuſtodia matrum

Again:

In treſs oppreſſa || gravi ſub religione

Again:

Et quorum pars magna || fui; quis talia fando

This contributes to diverſify the melody; and, where the words are ſmooth and liquid, is not ungraceful; as in the following examples:

Formoſam reſonare || doces Amarylida ſylvas

Again:

Agricolæ, quibus ipſa || procul diſcordibus armis

If this pauſe, placed as aforeſaid after the ſhort ſyllable, happen alſo to divide a word, the melody by theſe circumſtances is totally annihilated. Witneſs the following line of Ennius, which is plain proſe:

Romæ mœnia terru||it impiger | Hannibal armis.

Hitherto the arrangement of the long and ſhort ſyllables of an hexameter line and its different pauſes, have been conſidered with reſpect to melody: but to have a juſt notion of hexameter verſe, theſe particulars muſt alſo be conſidered with reſpect to ſenſe. There is

not, perhaps, in any other ſort of verſe, ſuch latitude in the long and ſhort ſyllables; a circumſtance that contributes greatly to that richneſs of melody which is remarkable in hexameter verſe, and which made Ariſtotle pronounce, that an epic poem in any other verſe would not ſucceed \*. One defect, however, \* *Post. cap. 25.* muſt not be diſſembled, that the ſame means which contribute to the richneſs of the melody, render it leſs fit than ſeveral other ſorts for a narrative poem. There cannot be a more artful contrivance, as above obſerved, than to cloſe an hexameter line with two long ſyllables preceded by two ſhort: but unhappily this conſtruction proves a great embarraſſment to the ſenſe; which will thus be evident. As, in general, there ought to be a ſtrict concordance between the thought and the words in which it is dreſſed; ſo, in particular, every cloſe in the ſenſe ought to be accompanied with a cloſe in the ſound. In proſe, this law may be ſtrictly obſerved; but in verſe, the ſame ſtrictneſs would occaſion inſuperable difficulties. Willing to ſacrifice to the melody of verſe, ſome ſhare of the concordance between thought and expreſſion, we freely excuſe the ſeparation of the muſical pauſe from that of the ſenſe, during the courſe of a line; but the cloſe of an hexameter line is too conspicuous to admit this liberty: for which reaſon there ought always to be ſome pauſe in the ſenſe at the end of every hexameter line, were it but ſuch a pauſe as is marked by a comma; and for the ſame reaſon, there ought never to be a full cloſe in the ſenſe but at the end of a line, becauſe there the melody is cloſed. An hexameter line, to preſerve its melody, cannot well admit any greater relaxation; and yet, in a narrative poem, it is extremely difficult to adhere ſtrictly to the rule even with theſe indulgences. Virgil, the chief of poets for verification, is forced often to end a line without any cloſe in the ſenſe, and aſ often to cloſe the ſenſe during the running of a line; though a cloſe in the melody during the movement of the thought, or a cloſe in the thought during the movement of the melody, cannot be agreeable.

The accent, to which we proceed, is not leſs eſſential than the other circumſtances above handled. By a good ear it will be diſcerned, that in every line there is one ſyllable diſtinguiſhable from the reſt by a capital accent: that ſyllable, being the ſeventh portion, is invariably long.

Nec bene promeritis || capitur nec | tangitur ira

Again:

Non ſibi ſed toto || genitum ſe | credere mundo

Again:

Qualis ſpelunca || ſubitò com | mota columba

In theſe examples, the accent is laid upon the laſt ſyllable of a word; which is favourable to the melody in the following reſpect, that the pauſe, which for the ſake of reading diſtinctly muſt follow every word, gives opportunity to prolong the accent. And for that reaſon, a line thus accented, has a more ſpirited air, than when the accent is placed on any other ſyllable. Compare the foregoing lines with the following.

Alba neque Aſſyrio || ſucatur | lana veneno

Again:

Panditur interca || domus omnipo | tentis Olympi

Again:

Verifica-  
tion.

Again :

Olli sedato || respōdit | corde Latinus.

In lines where the pause comes after the short syllable succeeding the fifth portion, the accent is displaced, and rendered less sensible : it seems to be split into two, and to be laid partly on the fifth portion, and partly on the seventh its usual place ; as in

Nuda genu, nodōque || sūds ool | lecta fluentes.

Again :

Formosam resonāre || docēs Amar | yllida sylvas.

Beside this capital accent, slighter accents are laid upon other portions ; particularly upon the fourth, unless where it consists of two short syllables ; upon the ninth, which is always a long syllable ; and upon the eleventh, where the line concludes with a monosyllable. Such conclusion, by the by, impairs the melody, and for that reason is not to be indulged unless where it is expressive of the sense. The following lines are marked with all the accents.

Ludere quæ velleſſem calamō permīſit agreſſi

Again :

Et duræ quærcus sudābunt rôſcida mella

Again :

Parturiunt mōntes, naſcētur ridiculūſ mus.

Reflecting upon the melody of hexameter verse, we find, that order or arrangement doth not constitute the whole of it : for when we compare different lines, equally regular as to the succession of long and short syllables, the melody is found in very different degrees of perfection ; which is not occasioned by any particular combination of dactyles and spondees, or of long and short syllables, because we find lines where dactyles prevail, and lines where spondees prevail, equally melodious. Of the former take the following instance :

Æneadum genitrix hominum divumque voluptas.

Of the latter :

Molli paulatim flavesceſſet campus arida.

What can be more different as to melody than the two following lines, which, however, as to the succession of long and short syllables, are constructed precisely in the same manner.

Spond. Dact. Spond. Spond. Dact. Spond.

Ad talos ſkola dimiſſa et circumdata palla. Hor.

Spond. Dact. Spond. Spond. Dact. Spond. Placatumque nitet diſſuſo lumine cælum. Lucret.

In the former, the pause falls in the middle of a word, which is a great blemish, and the accent is disturbed by a harsh elision of the vowel *a* upon the particle *et*. In the latter, the pauses and the accent are all of them distinct and full : there is no elision : and the words are more liquid and sounding. In these particulars consists the beauty of an hexameter line with respect to melody ; and by neglecting these, many lines in the satires and epistles of Horace are less agreeable than plain prose ; for they are neither the one nor the other in perfection. To draw melody from these lines, they must be pronounced without relation to the sense : it must not be regarded, that words are divided by pauses, nor that harsh elisions are multiplied. To add

to the account, prosaic low sounding words are introduced ; and, which is still worse, accents are laid on them. Of such faulty lines take the following instances.

Candida rectaque ſit, munda hæcenus ſit neque longa.

Jupiter exclamat ſimul atque audiri ; at in ſe

Cuſtodes, leſtica, ciniflones, paraſitæ

Optimus eſt modulatur, ut Alfenus Vaſer omni

Nunc illud tantum quæram, meritone tibi ſit.

II. Next in order comes English heroic verse ; which shall be examined under the whole five heads, of number, quantity, arrangement, pause, and accent. This verse is of two kinds ; one named *rhyme* or *metre*, and one *blank verse*. In the former, the lines are connected two and two by similarity of sound in the final syllables ; and two lines so connected are termed a *couplet* : similarity of sound being avoided in the latter, couplets are banished. These two sorts must be handled separately, because there are many peculiarities in each.

(1.) Beginning with rhyme or metre, the first article shall be discussed in a few words. Every line consists of ten syllables, five short and five long ; from which there are but two exceptions, both of them rare. The first is, where each line of a couplet is made eleven syllables, by an additional short syllable at the end :

There heroes' wits are kept in pond'rous vases,  
And beaus' in snuff-boxes and tweezer-cases.  
The piece, you think, is incorrect? Why, take it,  
I'm all submission ; what you'd have it, make it.

This licence is sufferable in a single couplet ; but if frequent, would give disgust.

The other exception concerns the second line of a couplet, which is sometimes stretched out to 12 syllables, termed an *Alexandrine line* :

A needſſeſ Alexandrine ends the ſong, [along.  
That, like a wounded ſnake, drags its ſlow length

It doth extremely well when employed to close a period with a certain pomp and solemnity, where the subject makes that tone proper.

With regard to quantity, it is unnecessary to mention a second time, that the quantities employed in verse are but two, the one double of the other ; that every syllable is reducible to one or other of these standards ; and that a syllable of the larger quantity is termed *long*, and of the lesser quantity *short*. It belongs more to the present article, to examine what peculiarities there may be in the English language as to long and short syllables. Every language has syllables that may be pronounced long or short at pleasure ; but the English above all abounds in syllables of that kind. In words of three or more syllables, the quantity for the most part is invariable : the exceptions are more frequent in dissyllables : but as to monosyllables, they may, without many exceptions, be pronounced either long or short ; nor is the ear hurt by a liberty that is rendered familiar by custom. This shows, that the melody of English verse must depend less upon quantity than upon other circumstances : in which it differs widely from Latin verse, where every syllable, having but

Verifica-  
tion.

but one found, strikes the ear uniformly with its accustomed impression; and a reader must be delighted to find a number of such syllables, disposed so artfully as to be highly melodious. Syllables variable in quantity cannot possess this power: for though custom may render familiar both a long and a short pronunciation of the same word; yet the mind, wavering between the two sounds, cannot be so much affected as where every syllable has one fixed found.

[103], 116. And with respect to arrangement, which may be brought within a narrow compass, the English heroic line is commonly iambic, the first syllable short, the second long, and so on alternately thro' the whole line. One exception there is, pretty frequent, of lines commencing with a trocheus, i. e. a long and a short syllable: but this affects not the order of the following syllables, which go on alternately as usual, one short and one long. The following couplet affords an example of each kind.

Some in the fields of pūrēst æthēr plāy,  
And bālk and whītēn in thē blāze of dāy.

117. It is a great imperfection in English verse, that it excludes the bulk of polysyllables, which are the most sounding words in our language; for very few of them have such alternation of long and short syllables as to correspond to either of the arrangements mentioned. English verse accordingly is almost totally reduced to dissyllables and monosyllables: *magnanimity* is a sounding word totally excluded: *impetuosity* is still a finer word, by the resemblance of the found and sense; and yet a negative is put upon it, as well as upon numberless words of the same kind. Polysyllables composed of syllables long and short alternately, make a good figure in verse; for example, *observance*, *opponent*, *ostensive*, *pindaric*, *productive*, *prolific*, and such others of three syllables. *Imitation*, *imperfection*, *misdemeanor*, *mitigation*, *moderation*, *observator*, *ornamental*, *regulator*, and others similar of four syllables, beginning with two short syllables, the third long, and the fourth short, may find a place in a line commencing with a trocheus.

One would not imagine, without trial, how uncouth false quantity appears in verse; not less than a provincial tone or idiom. The article *the* is one of the few monosyllables that is invariably short: observe how harsh it makes a line where it must be pronounced long:

This nŷmph, tō thē dēstrūctiōn of mānkīnd.  
Again,  
Th' advēnt'rōus bārōn thē brīght lōcks ādmīr'd.

Let it be pronounced short, and it reduces the melody almost to nothing: better so, however, than false quantity. In the following examples we perceive the same defect.

And old impertinence || expel by new  
With varying vanities || from ev'ry part  
Love in these labyrinths || his slaves detains  
New stratagems || the radiant lock to gain  
VOL. VIII.

Her eyes half languishing || half drown'd in tears  
Roar'd for the handkerchief || that caus'd his pain  
Passions like elements || though born to fight.

118. The great variety of melody conspicuous in English verse, arises chiefly from the pauses and accents; which are of greater importance than is commonly thought. The pause, which paves the way to the accent, offers itself first to our examination; and from a very short trial, the following facts will be verified. 1st, A line admits but one capital pause. 2d, In different lines, we find this pause after the fourth syllable, after the fifth, after the sixth, and after the seventh. These four places of the pause lay a solid foundation for dividing English heroic lines into four kinds; and unless the reader attend to this distinction, he cannot have any just notion of the richness and variety of English versification. Each kind or order hath a melody peculiar to itself, readily distinguishable by a good ear; the cause of which will be afterwards made evident. It must be observed, at the same time, that the pause cannot be made indifferently at any of the places mentioned: it is the sense that regulates the pause, as will be seen afterward; and consequently, it is the sense that determines of what order every line must be: there can be but one capital musical pause in a line; and that pause ought to coincide, if possible, with a pause in the sense, in order that the found may accord with the sense.

What is said shall be illustrated by examples of each sort or order. And first of the pause after the fourth syllable:

Back thro' the paths || of pleasing sense I ran  
Again,  
Profuse of bliss || and pregnant with delight

After the fifth;  
So when an angel || by divine command,  
With rising tempests || shakes a guilty land.

After the sixth:  
Speed the soft intercourse || from soul to soul  
Again,  
Then from his closing eyes || thy form shall part

After the seventh:  
And taught the doubtful battle || where to rage  
Again,  
And in the smooth description || murmur still

119. Beside the capital pause now mentioned, inferior pauses will be discovered by a nice ear. Of these there are commonly two in each line: one before the capital pause, and one after it. The former comes invariably after the first long syllable, whether the line begin with a long syllable or a short. The other in its variety imitates the capital pause: in some lines it comes after the sixth syllable, in some after the seventh, and in some after the eighth. Of these semipauses take the following examples.

1st and 8th:  
Led | through a sad || variety | of wo.

1st and 7th :

Still | on that breast || enamour'd | let me lie

2d and 8th :

From storms | a shelter || and from heat | a shade

2d and 6th :

Let wealth | let honour || wait | the wedded dame

2d and 7th :

Above | all pain || all passion | and all pride

Even from these few examples it appears, that the place of the last semipause, like that of the full pause, is directed in a good measure by the sense. Its proper place with respect to the melody is after the eighth syllable, so as to finish the line with an iambus distinctly pronounced, which, by a long syllable after a short, is a preparation for rest : but sometimes it comes after the sixth, and sometimes after the seventh syllable, in order to avoid a pause in the middle of a word, or between two words intimately connected; and so far melody is justly sacrificed to sense.

120. In discoursing of hexameter verse, it was laid down as a rule, That a full pause ought never to divide a word : such licence deviates too far from the coincidence that ought to be between the pauses of sense and of melody. The same rule must obtain in an English line; and we shall support reason by experiments :

A noble superfluity it craves

Abhor, a perpeituity should stand

These lines seem scarcely distinguishable from prose. The same rule is not applicable to a semipause, which, being short and faint, is not sensibly disagreeable when it divides a word.

Relent | less walls || whose darksome round | contains

For her | white virgins || hymn | neals sing

In these | deep solitudes || and aw | ful cells

It must however be acknowledged, that the melody here suffers in some degree : a word ought to be pronounced without any rest between its component syllables : a semipause that bends to this rule, is scarce perceived.

121. The capital pause is so essential to the melody, that one cannot be too nice in the choice of its place, in order to have it clear and distinct. It cannot be in better company than with a pause in the sense; and if the sense require but a comma after the fourth, fifth, sixth, or seventh syllable, it is sufficient for the musical pause. But to make such coincidence essential, would cramp versification too much; and we have experience for our authority, that there may be a pause in the melody where the sense requires none. We must not however imagine, that a musical pause may come after any word indifferently : some words, like syllables of the same word, are so intimately connected, as not to bear a separation even by a pause : the separating, for example, a substantive from its article would be harsh and unpleasant; witness the following line, which cannot be pronounced with a pause as marked,

If Delia smile, the || flow'r's begin to spring.

But ought to be pronounced in the following manner,

If Delia smile, || the flow'r's begin to spring.

If then it be not a matter of indifference where to make the pause, there ought to be rules for determining what words may be separated by a pause, and what are incapable of such separation. We shall endeavour to ascertain these rules; not chiefly for their utility, but in order to unfold some latent principles, that tend to regulate our taste even where we are scarce sensible of them : and to that end, the method that appears the most promising, is to run over the verbal relations, beginning with the most intimate. The first that presents itself, is that of adjective and substantive, being the relation of subject and quality, the most intimate of all : and with respect to such intimate companions, the question is, Whether they can bear to be separated by a pause. What occurs is, that a quality cannot exist independent of a subject; nor are they separable even in imagination, because they make parts of the same idea : and for that reason, with respect to melody as well as sense, it must be disagreeable to beflow upon the adjective a sort of independent existence, by interjecting a pause between it and its substantive; as in the following examples.

Of thousand bright || inhabitants of air

The sprites of fiery || termagants inflame

The rest, his many-colour'd || robe conceal'd

The same, his ancient || personage to deck

Ev'n here, where frozen || Chastity retires

I sit, with sad || civility, I read

Back to my native || moderation slide

Or shall we ev'ry || decency confound

Time was, a sober || Englishman would knock

And place, on good || security, his gold

Taste, that eternal || wanderer, which flies

But ere the tenth || revolving day was run

First let the just || equivalent be paid

Go, threat thy earth-born || myrmidons; but here

Haste to the fierce || Achilles' tent (he cries)

All but the ever-wakeful || eyes of Jove

Your own resistless || eloquence employ

122. Considering this matter superficially, one might be apt to imagine, that it must be the same, whether the adjective go first, which is the natural order, or the substantive, which is indulged by the laws of inversion. But we soon discover this to be a mistake : colour, for example, cannot be conceived independent of the surface coloured; but a tree may be conceived, as growing in a certain spot, as of a certain kind, and as spreading its extended branches all around, without ever thinking of its colour. In a word, a subject may be considered with some of its qualities independent of others; though we cannot form an image of any single quality independent of the subject. Thus then, tho' an adjective named first be inseparable from the substantive,

stantive, the proposition does not reciprocate: an image can be formed of the substantive independent of the adjective; and for that reason, they may be separated by a pause, when the substantive takes the lead.

For thee the fates || severely kind ordain  
And curs'd with hearts || unknowing how to yield

123. The verb and adverb are precisely in the same condition with the substantive and adjective. An adverb, which modifies the action expressed by the verb, is not separable from the verb even in imagination; and therefore the following lines seem faulty.

And which it much || becomes you to forget  
'Tis one thing madly || to disperse my store

But an action may be conceived with some of its modifications, leaving out others, precisely as a subject may be conceived with some of its qualities, leaving out others; and therefore, when by inversion the verb is first introduced, it has no bad effect to interject a pause between it and the adverb that follows: this may be done at the close of a line, where the pause is at least as full as that which divides the line:

While yet he spoke, the Prince advancing drew  
Nigh to the lodge, &c.

124. The agent and its action come next, expressed in grammar by the active substantive and its verb. Between these, placed in their natural order, there is no difficulty of interjecting a pause: an active being is not always in motion, and therefore it is easily separable in idea from its action: when in a sentence the substantive takes the lead, we know not that action is to follow; and as rest must precede the commencement of motion, this interval is a proper opportunity for a pause.

Nor when by inversion the verb is placed first, is it lawful to separate it by a pause from the active substantive; because an action is not in idea separable from the agent, more than a quality from the subject to which it belongs.

125. The point of the greatest delicacy regards the active verb and the passive substantive placed in their natural order. On the one hand, it will be observed, that these words signify things which are not separable in idea: killing cannot be conceived without a being that is put to death, nor painting without a surface upon which the colours are spread. On the other hand, an action and the thing on which it is exerted are not, like subject and quality, united in one individual object: the active substantive is perfectly distinct from that which is passive; and they are connected by one circumstance only, that the action exerted by the former is exerted upon the latter. This makes it possible to take the action to pieces, and to consider it first with relation to the agent, and next with relation to the patient. But after all, so intimately connected are the parts of the thought, that it requires an effort to make a separation even for a moment: the substituting to such a degree is not agreeable, especially in works of imagination. The best poets, however, taking advantage of this subtilty, scruple not to sepa-

rate by a pause an active verb from the thing upon which it is exerted. Such pauses in a long work may be indulged; but taken singly, they certainly are not agreeable:

The peer now spreads || the glitt'ring forsex wide  
As ever fully'd || the fair face of light  
Repair'd to search || the gloomy cave of Spleen  
Nothing, to make || philosophy thy friend  
Shou'd chance to make || the well-dress'd rabble stare  
Or cross, to plunder || provinces, the main  
These madmen ever hurt || the church or state  
How shall we fill || a library with wit  
What better teach || a foreigner the tongue  
Sure, if I spare || the minister, no rules  
Of honour bind me, not to maul his tools.

On the other hand, when the passive substantive is by inversion first named, there is no difficulty of interjecting a pause between it and the verb, more than when the active substantive is first named. The same reason holds in both, that though a verb cannot be separated in idea from the substantive which governs it, and scarcely from the substantive it governs; yet a substantive may always be conceived independent of the verb: when the passive substantive is introduced before the verb, we know not that an action is to be exerted upon it; therefore we may rest till the action commences. For the sake of illustration, take the following examples:

Shrines! where their vigils || pale-ey'd virgins keep  
Soon as thy letters || trembling I unclose  
No happier task || these faded eyes pursue

What is said about the pause, leadsto a general observation, That the natural order of placing the active substantive and its verb, is more friendly to a pause than the inverted order; but that in all the other connections, inversion affords a far better opportunity for a pause. And hence one great advantage of blank verse over rhyme; its privilege of inversion giving it a much greater choice of pauses than can be had in the natural order of arrangement.

126. We now proceed to the slighter connections, which shall be discussed in one general article. Words connected by conjunctions and prepositions admit freely a pause between them, which will be clear from the following instances:

Assume what fexes || and what shape they please  
The light militia || of the lower sky

Connecting particles were invented to unite in a period two substantives signifying things occasionally united in the thought, but which have no natural union: and between two things not only separable in idea, but really distinct, the mind, for the sake of melody, cheerfully admits by a pause a momentary disjunction of their occasional union.

127. One capital branch of the subject is still upon hand. It concerns those parts of speech which singly represent

sent no idea, and which become not significant till they be joined to other words: these are, conjunctions, prepositions, articles, and such like accessories, passing under the name of *particles*. Upon these the question occurs, Whether they can be separated by a pause from the words that make them significant? whether, for example, in the following lines, the separation of the accessory preposition from the principal substantive, be according to rule?

The goddess with || a discontented air  
And heighten'd by || the diamond's circling rays  
When victims at || yon altar's foot we lay  
So take it in || the very words of Creech  
An ensign of || the delegates of Jove  
Two ages o'er || his native realm he reign'd  
While angels, with || their silver wings o'ershade

Or the separation of the conjunction from the word that is connected by it with the antecedent word:

Talthybius and || Eurybates the good

It will be obvious at the first glance, that the foregoing reasoning upon objects naturally connected, is not applicable to words which of themselves are mere ciphers: we must therefore have recourse to some other principle for solving the present question. These particles out of their place are totally insignificant: to give them a meaning, they must be joined to certain words; and the necessity of this junction, together with custom, forms an artificial connection that has a strong influence upon the mind: it cannot bear even a momentary separation, which destroys the sense, and is at the same time contradictory to practice. Another circumstance tends still more to make this separation disagreeable in lines of the first and third order, that it bars the accent; which will be explained afterward in treating of the accent.

128. Hitherto we have discoursed upon that pause only which divides the line. We proceed to the pause that concludes the line; and the question is, Whether the same rules be applicable to both? This must be answered by making a distinction. In the first line of a couplet, the concluding pause differs little, if at all, from the pause which divides the line; and for that reason, the rules are applicable to both equally. The concluding pause of the couplet is in a different condition: it resembles greatly the concluding pause in an hexameter line: both of them indeed are so remarkable, that they never can be graceful, unless where they accompany a pause in the sense. Hence it follows, that a couplet ought always to be finished with some close in the sense; if not a point, at least a comma. The truth is, that this rule is seldom transgressed: in Pope's works we find very few deviations from the rule: take the following instances:

Nothing is foreign : parts relate to whole ;  
One all-extending, all-preserving soul.  
Connects each being —

Another:

To draw fresh colours from the vernal show'rs;

To steal from rainbows, ere they drop in show'rs,  
A brighter wash—

It may be added, with respect to pauses in general, that supposing the connection to be so slender as to admit a pause, it follows not that a pause may in every such case be admitted. There is one rule to which every other ought to bend, That the sense must never be wounded or obscured by the music; and upon that account the following lines seem exceptionable:

Ulysses, first || in public cares, the found,

And,

Who rising, high || th' imperial sceptre rais'd.

With respect to inversion, it appears, both from reason and experiments, that many words which cannot bear a separation in their natural order, admit a pause when inverted. And it may be added, that when two words, or two members of a sentence, in their natural order, can be separated by a pause, such separation can never be amiss in an inverted order. An inverted period, which deviates from the natural train of ideas, requires to be marked in some measure even by pauses in the sense, that the parts may be distinctly known. Take the following examples.

As with cold lips || I kiss'd the sacred veil  
With other beauties || charm my partial eyes  
Full in my view || set all the bright abode  
With words like these || the troops Ulysses rul'd  
Back to th' assembly roll || the thronging train  
Not for their grief || the Grecian host I blame

The same where the separation is made at the close of the first line of the couplet:

For spirits, freed from mortal laws, with ease,  
Assume what sexes and what shapes they please.

The pause is tolerable even at the close of the couplet, for the reason just now suggested, that inverted members require some slight pause in the sense:

'Twas where the plane-tree spreads its shades around :  
The altars heav'd ; and from the crumbling ground  
A mighty dragon shot.

129. Thus a train of reasoning hath insensibly led us to conclusions with regard to the musical pauses, very different from those in the article *Beauty of LANGUAGE* (sect. II.) concerning the separating by a circumstance words intimately connected. One would conjecture, that where-ever words are separable by interjecting a circumstance, they should be equally separable by interjecting a pause: but, upon a more narrow inspection, the appearance of analogy vaniseth. This will be evident from considering, that a pause in the sense distinguishes the different members of a period from each other; whereas when two words of the same member are separated by a circumstance, all the three make still but one member; and therefore that words may be separated by an interjected circumstance, though these words are not separated by a pause in the sense. This sets the matter in a clear light; for, as observed above, a musical pause is intimately connected with a pause in the sense, and ought, as far as possible, to be governed by it: particularly a musical pause ought never to be

Verifica-  
tion.

be placed where a pause is excluded by the sense, as, for example, between the adjective and following substantive, which make parts of the same idea; and still lies between a particle and the word that makes it significant.

Abstracting at present from the peculiarity of melody arising from the different pauses, it cannot fail to be observed in general, that they introduce into our verse no slight degree of variety. A number of uniform lines having all the same pause, are extremely fatiguing, which is remarkable in the French versification. This imperfection will be discerned by a fine ear even in the shortest succession, and becomes intolerable in a long poem. Pope excels in the variety of his melody, which, if different kinds can be compared, is indeed not less perfect than that of Virgil.

130. From what is last said, there ought to be one exception: Uniformity in the members of a thought, demands equal uniformity in the verbal members which express that thought. When therefore resembling objects or things are expressed in a plurality of verse-lines, these lines in their structure ought to be as uniform as possible, and the pauses in particular ought all of them to have the same place. Take the following examples.

By foreign hands || thy dying eyes were clos'd,  
By foreign hands || thy decent limbs compos'd,  
By foreign hands || thy humble grave adorn'd.

Again:

Bright as the sun || her eyes the gazers strike;  
And, like the sun, || they shine on all alike.

Speaking of Nature, or the God of Nature:

Warms in the sun || refreshes in the breeze,  
Glows in the stars || and blossoms in the trees,  
Lives through all life || extends through all extent,  
Spreads undivided || operates unspent.

131. Pauses will detain us longer than was expected; for the subject is not yet exhausted. It is laid down above, that English heroic verse admits no more but four capital pauses; and that the capital pause of every line is determined by the sense to be after the 4th, the 5th, the 6th, or 7th syllable. That this doctrine holds true so far as melody alone is concerned, will be testified by every good ear. At the same time it is to be admitted, that this rule may be varied where the sense or expression requires a variation, and that so far the melody may justly be sacrificed. Examples accordingly are not infrequent, in Milton especially, of the capital pause being after the 1st, the 2d, or the 3d syllable. And that this licence may be taken, even gracefully, when it adds vigour to the expression, will be clear from the following example. Pope, in his translation of Homer, describes a rock broken off from a mountain, and hurling to the plain, in the following words:

From sleep to sleep the rolling ruin bounds;  
At every shock the crackling wood resounds;  
Still gath'ring force, it smokes; and urg'd amain,  
Whirls, leaps, and thunders down, impetuous, to the plain:

Verifica-  
tion.

There stops || So Hector. Their whole force he prov'd,  
Reckless when he rag'd; and when he stop'd, unmov'd.

In the penult line the proper place of the musical pause is at the end of the 5th syllable; but it enlivens the expression by its coincidence with that of the sense at the end of the 2d syllable: the stopping short before the usual pause in the melody, aids the impression that is made by the description of the stone's stopping short; and what is lost to the melody by this artifice, is more than compensated by the force that is added to the description. Milton makes a happy use of this licence: witness the following examples from his *Paradise Lost*.

—Thus with the year  
Seasons return, but not to me returns  
Day || or the sweet approach of even or morn.  
Celestial voices to the midnight-air  
Sole || or responsive each to others note.  
And over them triumphant Death his dart  
Shook || but delay'd to strike.

—And wild uproar  
Stood rul'd || stood vast infinitude confin'd.  
—And hard'ning in his strength  
Glories || for never since created man  
Met such embodied force.

From his slack hand the garland wreath'd for Eve  
Down drop'd || and all the faded roses shed.

Of unessential night, receives him next,  
Wide gaping || and with utter loss of being,  
Threatens him, &c.

—For now the thought  
Both of lost happiness and lasting pain  
Torments him || round he throws his baleful eyes, &c.

If we consider the foregoing passages with respect to melody singly, the pauses are undoubtedly out of their proper place; but being united with those of the sense, they enforce the expression, and enliven it greatly; for, as has been more than once observed, the beauty of expression is communicated to the sound, which, by a natural deception, makes even the melody appear more perfect than if the musical pauses were regular.

132. To explain the rules of accenting, two general observations must be premised. The first is, That accents have a double effect: they contribute to the melody, by giving it air and spirit: they contribute no less to the sense, by distinguishing important words from others. These two effects can never be separated, without impairing the concord that ought to subsist between the thought and the melody: an accent, for example, placed on a low word, has the effect to burlesque it, by giving it an unnatural elevation; and the injury thus done to the sense does not rest there, for it seems also to injure the melody. Let us only reflect what a ridiculous figure a particle must make when an accent or emphasis put upon it, a particle that of itself has no meaning, and that serves only, like cement, to unite words significant. The other general observation is, That a word of whatever number of syllables, is not accented upon more than one of them,

them. The reason is, that the object is set in its best light by a single accent, so as to make more than one unnecessary for the sense; and if another be added, it must be for the sound merely; which would be a transgression of the foregoing rule, by separating a musical accent from that which is requisite for the sense.

133. Keeping in view the foregoing observations, the doctrine of accenting English heroic verse is extremely simple. In the first place, accenting is confined to the long syllables; for a short syllable is not capable of an accent. In the next place, as the melody is enriched in proportion to the number of accents, every word that has a long syllable may be accented; unless the sense interpose, which rejects the accenting a word that makes no figure by its signification. According to this rule, a line may admit five accents; a case by no means rare.

134. But supposing every long syllable to be accented, there is, in every line, one accent that makes a greater figure than the rest, being that which precedes the capital pause. It is distinguished into two kinds; one that is immediately before the pause, and one that is divided from the pause by a short syllable. The former belongs to lines of the first and third order: the latter to those of the second and fourth. Examples of the first kind:

Smooth flow the waves || the zephyrs gently play,  
Belinda smil'd || and all the world was gay.

He rais'd his azure wand || and thus began.

Examples of the other kind:

There lays three garters || half a pair of gloves,  
And all the trophies || of his former loves.

Our humble province || is to tend the fair,  
Not a less pleasing || though less glorious care.

And hew triumphal arches || to the ground.

135. It is a capital defect in the composition of verse, to put a low word, incapable of an accent, in the place where this accent should be: this bars the accent altogether; than which there seems no fault more subversive of the melody, if it be not the barring a pause altogether. Neither does any single circumstance contribute more to the energy of verse, than to put an important word where the accent should be, a word that merits a peculiar emphasis. To show the bad effect of excluding the capital accent, the reader is referred to some instances given above, where particles are separated by a pause from the capital words that make them significant; and which particles ought, for the sake of melody, to be accented, were they capable of an accent. Add to these the following instances from the Essay on Criticism.

Of leaving what || is natural and fit

Not yet purg'd off, || of spleen and four diddain

No pardon vile || obscenity should find

When love was all || an easy monarch's care

For 'tis but half || a judge's task, to know

'Tis not enough, || taste, judgment, learnings, join

That only makes || superior sense below'd

Whose right it is, || unceasur'd, to be dull

'Tis best sometimes || your censure to restrain

When this fault is at the end of a line that closes a couplet, it leaves not the least trace of melody:

But of this frame the bearings, and the ties,  
The strong connections, nice dependencies,

In a line expressive of what is humble or dejected, it improves the resemblance between the sound and sense to exclude the capital accent. This, to our taste, is a beauty in the following lines.

In these deep solitudes || and awful cells

The poor inhabitant || beholds in vain

136. To conclude this article, the accents are not, like the syllables, confined to a certain number: some lines have no fewer than five, and there are lines that admit not above one. This variety, as we have seen, depends entirely on the different powers of the component words: particles, even where they are long by position, cannot be accented; and polysyllables, whatever space they occupy, admit but one accent. Polysyllables have another defect, that they generally exclude the full pause. It is shown above, that few polysyllables can find place in the construction of English verse; and here are reasons for excluding them, could they find place.

137. It was mentioned above †, that the four sorts of † No 118. lines which enter into English heroic verse, have, each of them, a peculiar melody distinguishable by a good ear. This it is now proposed to account for. But first, it is proper to warn the candid reader not to expect this peculiarity of modulation in every instance: for the thought and expression have so great an influence, as often to make the poorest melody pass for rich and spirited. It is necessary therefore, first, That the experiment be tried upon lines equal with respect to the thought and expression; for otherwise one may easily be misled in judging of the melody: and next, That these lines be regularly accented before the pause; for upon a matter abundantly refined in itself, it is wisest not to be embarrassed with faulty and irregular lines.

These preliminaries adjusted, we begin with some general observations, that will save repeating the same thing over and over upon each particular case. And, first, an accent succeeded by a pause, as in lines of the first and third order, makes a much greater figure than where the voice goes on without a stop. The fact is so certain, that no person who has an ear can be at a loss to distinguish that accent from others. Nor have we far to seek for the efficient cause: the elevation of an accepting tone produceth in the mind a similar elevation,

vation, which continues during the pause (A): but where the pause is separated from the accent by a short syllable, as in lines of the second and fourth order, the impression made by the accent is more slight when there is no stop, and the elevation of the accent is gone in a moment by the falling of the voice in pronouncing the short syllable that follows. The pause also is sensibly affected by the position of the accent: in lines of the first and third order, the close conjunction of the accent and pause occasions a sudden stop without preparation, which routes the mind, and bestows on the melody a spirited air: when, on the other hand, the pause is separated from the accent by a short syllable, which always happens in lines of the second and fourth order, the pause is soft and gentle: for this short unaccented syllable succeeding one that is accented, must of course be pronounced with a falling voice, which naturally prepares for a pause; and the mind falls gently from the accented syllable, and slides into rest as it were insensibly. Further, the lines themselves derive different powers from the position of the pause, which will thus appear. A pause after the fourth syllable divides the line into two unequal portions, of which the larger comes last: this circumstance resolving the line into an ascending series, makes an impression in pronouncing like that of ascending; and to this impression contributes the redoubled effort in pronouncing the larger portion, which is last in order. The mind has a different feeling when the pause succeeds the fifth syllable, which divides the line into two equal parts: these parts, pronounced with equal effort, are agreeable by their uniformity. A line divided by a pause after the sixth syllable, makes an impression opposite to that first mentioned: being divided into two unequal portions, of which the shorter is last in order, it appears like a slow descending series; and the second portion being pronounced with less effort than the first, the diminished effort prepares the mind for rest. And this preparation for rest is still more sensibly felt where the pause is after the seventh syllable, as in lines of the fourth order.

138. To apply these observations is an easy task. A line of the first order is of all the most spirited and lively: the accent, being followed instantly by a pause, makes an illustrious figure: the elevated tone of the accent elevates the mind: the mind is supported in its elevation by the sudden unprepared pause which routes and animates: and the line itself, representing by its unequal division an ascending series, carries the mind still higher, making an impression similar to that of going upward. The second order has a modulation sensibly sweet, soft, and flowing: the accent is not so sprightly as in the former, because a short syllable intervenes between it and the pause; its elevation, by the same means, vanisheth instantaneously; the mind, by a falling voice, is gently prepared for a stop: and the pleasure of uniformity from the division of the line into two equal parts, is calm and sweet. The third order has a

modulation not so easily expressed in words: it in part resembles the first order, by the liveliness of an accent succeeded instantly by a full pause: but then the elevation occasioned by this circumstance, is balanced in some degree by the remitted effort in pronouncing the second portion, which remitted effort has a tendency to rest. Another circumstance distinguisheth it remarkably: its capital accent comes late, being placed on the sixth syllable, and this circumstance bestows on it an air of gravity and solemnity. The last order resembles the second in the mildness of its accent, and softness of its pause; it is still more solemn than the third, by the lateness of its capital accent: it also possesses in a higher degree than the third, the tendency to rest; and by that circumstance is of all the best qualified for closing a period in the completest manner.

139. But these are not all the distinguishing characters of the different orders. Each order also is distinguished by its final accent and pause: the unequal division in the first order, makes an impression of ascending; and the mind at the close is in the highest elevation, which naturally prompts it to put a strong emphasis upon the concluding syllable, whether by raising the voice to a sharper tone, or by expressing the word in a fuller tone. This order accordingly is of all the least proper for concluding a period, where a cadence is proper, and not an accent. The second order, being destitute of the impression of ascent, cannot rival the first order in the elevation of its concluding accent, nor consequently in the dignity of its concluding pause; for these have a mutual influence. This order, however, with respect to its close, maintains a superiority over the third and fourth orders: in these the close is more humble, being brought down by the impression of descent, and by the remitted effort in pronouncing; considerably in the third order, and still more considerably in the last. According to this description, the concluding accents and pauses of the four orders being reduced to a scale, will form a descending series probably in an arithmetical progression.

140. After what is said, it will scarce be thought refining too much to suggest, that the different orders are qualified for different purposes, and that a poet of genius will be naturally led to make a choice accordingly. The first order seems proper for a sentiment that is bold, lively, or impetuous; the third order, for what is grave, solemn, or lofty; the second, for what is tender, delicate, or melancholy, and in general for all the sympathetic emotions; and the last for subjects of the same kind, when tempered with any degree of solemnity. It is not contended that any one order is fitted for no other talk than that assigned it; for at that rate, no sort of melody would be left for accompanying thoughts that have nothing peculiar in them. It is meant to suggest, that each of the orders is peculiarly adapted to certain subjects, and better qualified than the others for expressing them. The best way to judge

18.

(A) Hence the liveliness of the French language as to sound, above the English; the last syllable in the former being generally long and accented, the long syllable in the latter being generally as far back in the word as possible, and often without an accent. For this difference there appears no cause so probable as temperament and disposition; the French being brisk and lively, the English sedate and reserved: and this, if it hold, is a pregnant instance of a resemblance between the character of a people and that of their language.

is by experiment; and to avoid the imputation of a partial search, the instances shall be confined to a single poem, beginning with the first order.

On her white breast a sparkling cross she wore,  
Which Jews might kiss, and infidels adore.  
Her lively looks a sprightly mind disclose,  
Quick as her eyes, and as unfix'd as those:  
Favours to none, to all the smiles extends;  
Oft she rejects, but never once offends.  
Bright as the sun, her eyes the gazers strike;  
And, like the sun, they shine on all alike.  
Yet graceful ease, and sweetness void of pride,  
Might hide her faults, if belles had faults to hide;  
If to her share some female errors fall,  
Look on her face, and you'll forget 'em all.

*Rape of the Lock.*

In accounting for the remarkable liveliness of this passage, it will be acknowledged by every one who has an ear, that the melody must come in for a share. The lines, all of them, are of the first order; a very unusual circumstance in the author of this poem, so eminent for variety in his verification. Who can doubt, that he has been led by delicacy of taste to employ the first order preferably to the others?

Second order.

Our humble province is to tend the fair,  
Not a less pleasing, though less glorious care;  
To save the powder from too rude a gale,  
Nor let th' imprison'd essences exhale;  
To draw fresh colours from the vernal flow'rs;  
To steal from rainbows, ere they drop their show'rs,  
&c.

Again:

Oh, thoughtless mortals! ever blind to fate,  
Too soon dejected, and too soon elate.  
Sudden, these honours shall be snatch'd away,  
And curs'd for ever this victorious day.

Third order.

To fifty chosen sylphs, of special note,  
We trust th' important charge, the petticoat.

Again:

Oh say what stranger cause, yet unexplor'd,  
Could make a gentle belle reject a lord?

A plurality of lines of the fourth order, would not have a good effect in succession; because, by a remarkable tendency to rest, their proper office is to close a period. The reader, therefore, must be satisfied with instances where this order is mixed with others.

Not louder shrieks to pitying heav'n are cast,  
When husbands, or when lapdogs, breathe their last.

Again:

Steel could the works of mortal pride confound,  
And hew triumphal arches to the ground.

Again:

She sees, and trembles at th' approaching ill,  
Just in the jaws of ruin, and codille.

Again:

With earnest eyes, and round unthinking face,  
He first the snuff-box open'd, then the case.

And this suggests another experiment, which is, to set the different orders more directly in opposition, by

giving examples where they are mixed in the same passage.

First and second orders.

Sol through white curtains shot a tim'rous ray,  
And open'd those eyes that must eclipse the day.

Again:

Not youthful kings in battle seiz'd alive,  
Not scornful virgins who their charms survive,  
Not ardent lovers robb'd of all their bliss,  
Not ancient ladies when refus'd a kiss,  
Not tyrants fierce that unrepenting die,  
Not Cynthia when her mantua's pin'd awry,  
E'er felt such rage, repentment, and despair,  
As thou, sad virgin! for thy ravish'd hair.

First and third.

Think what an equipage thou hast in air.  
And view with scorn two pages and a chair.

Again:

What guards the purity of melting maids,  
In courtly balls, and midnight masquerades,  
Safe from the treach'rous friend, the daring spark,  
The glance by day, the whisper in the dark?

Again:

With tender billet-doux he lights the pyre,  
And breathes three am'rous sighs to raise the fire;  
Then prostrate falls, and begs, with ardent eyes,  
Soon to obtain, and long possess the prize.

Again:

Jove's thunder roars, heav'n trembles all around,  
Blue Neptune storms, the bellowing deeps resound,  
Earth shakes her nodding tow'rs, the ground gives way,  
And the pale ghosts start at the flash of day!

Second and third.

Sunk in Thales' arms, the nymph he found,  
Her eyes dejected, and her hair unbound.

Again:

On her heav'd bosom hung her drooping head,  
Which with a sigh she rais'd; and thus she said.

141. Upon the whole, from what has been observed, we may with assurance pronounce, that great is the merit of English heroic verse: for though uniformity prevails in the arrangement, in the equality of the lines, and in the resemblance of the final sounds; variety is still more conspicuous in the pauses and in the accents, which are diversified in a surprising manner. Of the beauty that results from a due mixture of uniformity and variety\*, many instances have already occurred, but none more illustrious than English verse: its arrangement, it is highly melodious by its pauses and accents, so as already to rival the most perfect species known in Greece or Rome; and it is no disagreeable prospect to find it susceptible of still greater refinement.

142. (2.) We proceed to blank verse, which hath so many circumstances in common with rhyme, that its peculiarities may be brought within a narrow compass. With respect to form, it differs from rhyme in rejecting the jingle of similar sounds, which purifies it from a childish pleasure. But this improvement is a trifle

trifle compared with what follows. Our verse is extremely cramped by rhyme; and the great advantage of blank verse is, that it is at liberty to attend the imagination in its boldest flights. Rhyme necessarily divides verse into couplets: each couplet makes a complete musical period, the parts of which are divided by pauses, and the whole summed up by a full close at the end: the melody begins anew with the next couplet: and in this manner a composition in rhyme proceeds couplet after couplet. We have frequently had occasion to mention the correspondence and concord that ought to subsist between sound and sense; from which it is a plain inference, that if a couplet be a complete period with regard to melody, it ought regularly to be the same with regard to sense. As it is extremely difficult to support such strictness of composition, licences are indulged, as explained above; which, however, must be used with discretion, so as to preserve some degree of concord between the sense and the music: There ought never to be a full close in the sense but at the end of a couplet; and there ought always to be some pause in the sense at the end of every couplet: the same period as to sense may be extended through several couplets; but each couplet ought to contain a distinct member, distinguished by a pause in the sense as well as in the sound; and the whole ought to be closed with a complete cadence. Rules such as these must confine rhyme within very narrow bounds; a thought of any extent cannot be reduced within its compass; the sense must be curtailed and broken into parts, to make it square with the curtness of the melody; and beside, short periods afford no latitude for inversion.

143. We have examined this point with the greater accuracy, in order to give a just notion of blank verse; and to show, that a slight difference in form may produce a very great difference in substance. Blank verse has the same pauses and accents with rhyme, and a pause at the end of every line, like what concludes the first line of a couplet. In a word, the rules of melody in blank verse, are the same that obtain with respect to the first line of a couplet; but being disengaged from rhyme, or from couplets, there is access to make every line run into another, precisely as to make the first line of a couplet run into the second. There must be a musical pause at the end of every line; but this pause is so slight as not to require a pause in the sense: and accordingly the sense may be carried on with or without pauses, till a period of the utmost extent be completed by a full close both in the sense and the sound: there is no restraint, other than that this full close be at the end of a line; and this restraint is necessary, in order to preserve a coincidence between sense and sound, which ought to be aimed at in general, and is indispensable in the case of a full close, because it has a striking effect. Hence the fitness of blank verse for inversion: and consequently the lustre of its pauses and accents; for which, as observed in the article lately referred to, there is greater scope in inversion, than when words run in their natural order.

144. Nothing contributes more than inversion to the force and elevation of language: the couplets of rhyme  
VOL. VIII.

confine inversion within narrow limits; nor would the elevation of inversion, were there access for it in rhyme, readily accord with the humbler tone of that sort of verse. It is universally agreed, that the loftiness of Milton's style supports admirably the sublimity of his subject; and it is not less certain, that the loftiness of his style arises chiefly from inversion. Shakspeare deals little in inversion; but his blank verse being a sort of measured prose, is perfectly well adapted to the stage, where laboured inversion is highly improper, because in dialogue it never can be natural.

145. Hitherto we have considered that superior power of expression which verse acquires by laying aside rhyme. But this is not the only ground for preferring blank verse: it has another preferable quality not less signal; and that is, a more extensive and more complete melody. Its music is not, like that of rhyme, confined to a single couplet, but takes in a great compass, so as in some measure to rival music properly so called. The interval between its cadences may be long or short at pleasure; and by that means its melody, with respect both to richness and variety, is superior far to that of rhyme, and superior even to that of the Greek and Latin hexameter. Of this observation no person can doubt who is acquainted with the *Paradise Lost*: in which work there are indeed many careless lines; but at every turn the richest melody as well as the sublimest sentiments are conspicuous. Take the following specimen.

Now Morn, her rosy steps in th' eastern clime  
Advancing, sow'd the earth with orient pearl;  
When Adam wak'd, so custom'd, for his sleep  
Was airy light from pure digestion bred,  
And temperate vapours bland, which th' only sound  
Of leaves and fuming rills, Aurora's fan,  
Lightly dispers'd, and the shrill matin song  
Of birds on ev'ry bough; so much the more  
His wonder was to find unawaken'd Eve  
With tresses discompos'd, and glowing cheek,  
As through unquiet rest: he on his side  
Leaning half-raisd, with looks of cordial love  
Hung over her enamour'd, and beheld  
Beauty, which, whether waking or asleep,  
Shot forth peculiar graces; then with voice  
Mild, as when Zephyrus on Flora breathes,  
Her hand soft touching, whisper'd thus. Awake,  
My fairest, my espous'd, my latest found,  
Heav'n's last best gift, my ever-new delight,  
Awake; the morning shines, and the fresh field  
Calls us; we lose the prime, to mark how spring  
Our tended plants, how blows the citron grove,  
What drops the myrrh, and what the balmy reed,  
How nature paints her colours, how the bee  
Sits on the bloom extracting liquid sweet.

Book 5. l. 1.

146. Comparing Latin Hexameter with English heroic rhyme, the former has obviously the advantage in the following particulars. It is greatly preferable as to arrangement, by the latitude it admits in placing the long and short syllables. Secondly, the length of an hexameter line hath a majestic air: ours, by its shortness, is indeed more brisk and lively, but much less fitted for the sublime. And, thirdly, the long high-  
35 R founding

foundings words that hexameter admits, add greatly to its majesty. To compensate these advantages, English rhyme possesses a greater number and greater variety both of pauses and of accents. These two sorts of verse stand indeed pretty much in opposition: in hexameter, great variety of arrangement, none in the pauses nor accents: in English rhyme, great variety in the pauses and accents, very little in the arrangement.

147. In blank verse are united, in a good measure, the several properties of Latin hexameter and English rhyme; and it possesses beside many signal properties of its own. It is not confined, like hexameter, by a full close at the end of every line; nor, like rhyme, by a full close at the end of every couplet. Its construction, which admits the lines to run into each other, gives it a still greater majesty than arises from the length of a hexameter line. By the same means, it admits inversion even beyond the Latin or Greek hexameter; for these suffer some confinement by the regular closes at the end of every line. In its music it is illustrious above all: the melody of hexameter verse, is circumscribed to a line; and of English rhyme, to a couplet: the melody of blank verse is under no confinement, but enjoys the utmost privilege of which melody of verse is susceptible; which is, to run hand in hand with the sense. In a word, blank verse is superior to hexameter in many articles; and inferior to it in none, save in the freedom of arrangement, and in the use of long words.

148. In French heroic verse, there are found, on the contrary, all the defects of Latin hexameter and English rhyme, without the beauties of either: subjected to the bondage of rhyme, and to the full close at the end of every couplet, it is also extremely fatiguing by uniformity in its pauses and accents: the line invariably is divided by the pause into two equal parts, and the accent is invariably placed before the pause:

Jeune et vaillant herôs | dont la haute sagesse  
N'est point la fruit tardif | d'une lente vieillesse.

Here every circumstance contributes to a tiresome uniformity: a constant return of the same pause and of the same accent, as well as an equal division of every line; which fatigue the ear without intermission or change. This matter cannot be set in a better light, than by presenting to the reader a French translation of the following passage of Milton:

- Two of far nobler shape, erect and tall,  
Godlike erect, with native honour clad,  
In naked majesty, seem'd lords of all:  
And worthy seem'd; for in their looks divine  
The image of their glorious Maker shone,  
Truth, wisdom, sanctitude severe and pure;  
Severe, but in true filial freedom plac'd;  
Whence true authority in men: though both  
Not equal, as their sex not equal seem'd;  
For contemplation he and valour form'd,  
For softness he and sweet attractive grace;  
He for God only, she for God in him.

Were the pauses of the sense and sound in this passage but a little better assorted, nothing in verse could be

more melodious. In general, the great defect of Milton's versification, in other respects admirable, is the want of coincidence between the pauses of the sense and sound.

The translation is in the following words:

Ce lieux délicieux, ce paradis charmant,  
Reçoit deux objets son plus bel ornement;  
Leur port majestueux, et leur démarche altière,  
Semble leur meriter sur la nature entière,  
Ce droit de commander que Dieu leur a donné,  
Sur leur auguste front de gloire couronné.  
Du Souverain du ciel drille la ressemblance:  
Dans leur simples regards éclatle l'innocence,  
L'adorable candeur, l'aimable vérité,  
La raison, la sagesse, et la sévérité,  
Qu'adoucit la prudence, et cet air de droiture  
Du visage des rois respectable parure.  
Ces deux objets divins n'ont pas les mêmes traits,  
Ils paroissent formées, quoique tous deux parfaits;  
L'un pour la majesté, la force, et la noblesse;  
L'autre pour la douceur, la grace, et la tendresse;  
Celui-ci pour Dieu seul, l'autre pour l'homme encor.

Here the sense is fairly translated, the words are of equal power, and yet how inferior the melody!

149. The present article shall be concluded with

*A List of the different FEET, and of their NAMES.*

1. PYRRHICHIUS, consists of two short syllables. Examples: *Deus, given, cannot, billock, running.*
2. SPONDEUS, consists of two long syllables: *omnes, possess, forewarn, mankind, sometime.*
3. IAMBUS, composed of a short and a long: *poor, intent, degree, appear, consent, repent, demand, report, suspect, affront, event.*
4. TROCHÆUS, or CHOREUS, a long and a short: *servat, whereby, after, legal, measure, burden, holy, lefty.*
5. TRIBRACHYS, three short: *melius, property.*
6. MOLOSSUS, three long: *delectant.*
7. ANAPÆSTUS, two short and a long: *animos, condescend, apprehend, overheard, acquiesce, immature, overcharge, serenade, opportune.*
8. DACTYLUS, a long and two short: *carmina, evident, excellence, estimate, wonderful, altitude, burdened, minister, tenement.*
9. BACCHIUS, a short and two long: *dolores.*
10. HYPOBACCHIUS, or ANTIBACCHIUS, two long and a short: *pelluntur.*
11. CRETICUS, or AMPHIMACER, a short syllable between two long: *insito, afternoon.*
12. AMPHIBRACHYS, a long syllable between two short: *honore, consider, imprudent, procedure, attended, proposed, respondent, concurrence, apprentice, respective, revenue.*
13. PROCELEUSMATICUS, four short syllables: *bonibus, necessary.*

14. DIS-

14. DISPONDEUS, four long syllables : *infinitus*.
15. DIAMBUS, composed of two iambs : *severitas*.
16. DITROCHÆUS, of two trochæi : *permanere, procurator*.
17. IONICUS, two short syllables and two long : *properabant*.
18. Another foot passes under the same name, composed of two long syllables and two short : *calcarius, possessory*.
19. CHORIAMBUS, two short syllables between two long : *nobilitas*.
20. ANTISPASTUS, two long syllables between two short : *Alexander*.
21. PÆON 1st, one long syllable and three short : *temporibus, ordinary, inventory, temperament*.
22. PÆON 2d, the second syllable long, and the other three short : *rapidity, solemnity, minority, considered, imprudently, extravagant, respectfully, accordingly*.
23. PÆON 3d, the third syllable long and the other three short : *animatus, independent, condescendence, sacerdotal, reimbursement, manufacture*.
24. PÆON 4th, the last syllable long and the other three short : *celeritas*.
25. EPITRITUS 1st, the first syllable short and the other three long : *voluptates*.
26. EPITRITUS 2d, the second syllable short and the other three long : *pœnitentes*.
27. EPITRITUS 3d, the third syllable short and the other three long : *discordias*.
28. EPITRITUS 4th, the last syllable short and the other three long : *fortunatus*.
29. A word of five syllables composed of a pyrrhichius and dactylus : *ministerial*.
30. A word of five syllables composed of a trochæus and dactylus : *singularity*.
31. A word of five syllables composed of a dactylus and trochæus : *precipitation, examination*.
32. A word of five syllables, the second only long : *significancy*.
33. A word of six syllables composed of two dactyles : *impetuosify*.
34. A word of six syllables composed of a tribrachys and dactyle : *pusillanimity*.
